One last point Jeff

I had problems with the soundmodem/Linux PTT via the serial port and looking in NG's so did some others. I ended up using the printer port.

I *think* there is a fix for this but havent investigated. My problem was that the PTT asserted whenever the soundmodem process was started. It wasnt reversed either. (ie the PTT didnt drop when I tried to TX!)

Cheers Bob

Try to connect to it with a dumb terminal program. 8N1 setting. Type
*** and you should get the PK232 welcome text and command prompt.

Bye Maurice

Have been using WinPSK for awhile with no issues.
Upgraded software to new version 2.13.
Suddenly (?) the F1 key macro to start TX keeps bringing up the Help Window
at the same time it starts transmitting, and since the window is on top of
WinPSK it's sorta hard to see what I am doing.
The code in the macro is the same, I can close the Help Window, but
everytime I use the F1 key it pops back up.
Clicking the mouse on the macro button works just fine..... okay then "just
click on the macro buttton.", could but it's just not as quick.

Also I programmed the F6 key with the same code and it works perfect. I'm
just used to using the "default" F1 key.
Is there a setting that I goofed up somewhere?

That's good to know. I've used the MFJ-1275 before with RedHat 8.0 and it
seemed to work well, but I'll watch for the PTT problem you have described.

Thanks,
Jeff

Hi all,
    Please refer to the previous post of the ARRL Proposal... That I just
```

posted moments ago..
The ARRL Has taken Back Water.
They told us in December that the Automatically Controlled Digital Sub-Bands would be left alone...
Now it is clear they have decided not to make that decsion until the July Meeting..
We need to stop talking with the ARRL, Get a Show of hands of those who would reject any FCC NPRM that would eliminate the Automatcially Controlled Subbands.

The time to act is now.. We have been in negotiations for the last 6 months.. Not getting anywhere.. Its time we started preparing our defense.

Thanks..

73 Jerry

29 JAN, 2005 - 1425 CST

Jerry Kutche, N9LYA

Hello Jerry...

I have been slow in responding to your inquiries because the ARRL Executive Committee held a conference call Monday evening before the January ARRL board meeting to discuss its recommendations for changes to the ARRL's proposal to regulate ARS sub-bands by bandwidth rather than mode. Then most of us were delayed in our return home by the "blizzard of '05" - I was a day and a half late getting home. And now, I'm still recovering from a mutation of the flu I caught in Connecticut that was not covered in the flu inoculation I received last fall.

In actuality, the ARRL proposal is a bit of a hybrid of the two concepts in an effort to keep from displacing existing users or at least to minimize changing pre-existing uses. At its regular meeting last fall, the ARRL EC voted to include the small HF sub-bands that currently allow automatic (fully robotic at both ends of the circuit) packet and other digital message forwarding. As you know, the draft proposal under development for the last three plus years, would eliminate this set of small HF sub-bands. During this conference call the EC reversed itself and removed its recommendation of retaining this set of HF sub-bands. The decision was not unanimous and votes on some of the other issues in this proposal were also split.

Therefore, the full ARRL board accepted the first part of the EC's fall meeting recommendations of the bandwidth petition proposal, and asked the EC to continue its discussion of the unresolved issues. The minutes of the January 2005 board meeting are now on the ARRL web site. Rather than type in all the words here, I refer you to Minute 38 of this document for an understanding of what the Executive Committee is still tasked with doing before the July 2005 board meeting. I'm not happy with the EC's reversal on automatic forwarding, but it will again be discussed at the spring Executive Committee meeting. The board meeting minutes can be read at:

http://www.arrl.org/announce/board-0501/

Due to the FCC-induced log-jam of Amateur Radio petitions now before the Commission going clear back to "Novice Refarming", we are in no hurry to add another petition to the pile until the others, including "license restructuring" have at least reached Proposed Rule-Making (PRM) status. This could happen as early as this coming May, but don't hold your breath. The five man FCC appears to be going through a major re-shuffling and we are not certain how this will affect current filed petitions. There are simply too many variables in this equation to make a well reasoned guess.

In closing, I must emphasize that the HF auto-forwarding issue is far from decided at this point. And even after the full board renders its decision there are no certainties about when and how the FCC will deal with this ARRL regulatory proposal.

73 - Dick Isely, W9GIG

```

I ordered mine over 8 days ago and so far not a word from qrz.com except an "order confirmation" on Dec 25 and a charge to our CC of course. The "new CD" was advertised as "available now" on the web site.

Why not address this to "QRZ.com", rather than spamming several
Internet Newsgroups that can't help you one bit?

My "pals" are generally more "with it" than to put such a rhetorical question in a forum where it will only bring humiliation on the author.

Kinda like you were.

Received my copy of "Volume 24, Winter 2004-2005 QRZ Callsign Databae" last
year sometime. I remember it came in the mail the day after they said it
would be available. The charge showed up later.

I am very sure that QRZ.com is very much aware that they must not charge
your credit card until shipment has taken place. The fact that they did
tells me that you need to report to them that nothing has been received and
ask them to trace the shipment. They are just too reputable, a break down
in the shipping path has occured.

To remind you just WHO'S YOUR DADDY anymore, this item makes the news:

"Bush Prepares for Possible GPS Shutdown"

http://tinyurl.com/7yw9d

Of course most people have known this was always possible, but the timing of the news story is curious: There are no coincidences in DC. The article also recalls the removal of the dithering (allowing the public greater accuracy in their gps measurements) in - drum roll - 2000. Ah-yeah. Look for the Freakshow Junta to claim that CL1NT000N GAVE THE TERRISTS USE OUR SUPER GPS TECH!!!

What's the status of Galileo anyway?

Sorry Brian, but you were reaching for "armature".

Simon's use of "Amature" may seem like a simple lack of spelling ability (or an indication he can't figure out how to turn on his spill chucker), but he has coined a new word that really works.

Taking the root of "Amature" to be "Mature", we all understand that meaning. Adding the "A" prefix is adding a negative conditional (just as "typical" becomes negated in "atypical"). Thus, "Amature" would be the term for "not mature". It really works!

Cool! Thanks for the tip. I know I've seen references to these devices in the Linux kernel menu config. I see that my Debian installation has a wavelan module so that hardware is probably supported. I'll have to keep an eye out at the next hamfest.

Thanks!

73, de Nate >>

For sale or for trade.

If you know someone with a repeater
on 440.6 MHz or 445.6 MHz please
forward this to him.

Due to a repeater changing frequency
I have a spare Micor RX element (KXN1024)
set up on 440.600mhz. It was rebuilt and
temp-comp'd by International Crystal.

Sorry, we don't run under a democracy. If we did, Al Gore would have
been president. The USA is a *Republic*, not a democracy. Our Constitution
protects us from the tyranny of the majority. We don't have to drink
hemlock simply because the majority wants us to. (Socrates drank Hemlock
and died because the majority voted for it.)

If your newsreader is text-only, I've got the text and all links at
http://kiloseven.blogspot.com/2004/12/packet-interface-for-ht-and.html#

I've got a one-kilo featherweight notebook, a <a
href="http://www.gotocol.com/fujitsup1032.html">Fujitsu P1032 (700 MHz
Transmeta CPU, about like a Pentium III-450MHz) I picked up for travel. It
has no serial port, and the thought of adding a serial->USB adapter plus a
spendy TNC has kept me from adding packet to my Yaesu VX-5R. I'd have to
tote around:

1. HT
2. HT's power brick
3. HT's antenna
4. Cable into HT
5. Laptop computer
6. Laptop's power brick
7. USB to serial adapter
8. Serial cable to TNC
9. TNC
10. TNC's power brick

I suppose I could add the $67 <a
href="http://www.tigertronics.com/sl_main.htm">Tigertronics Signalink (
QST review here with
its <a
href="http://www.tigertronics.com/
sl_main.htm#Optional%20Cable%20Accessory%20Kit%20(P/N%20SLASSY)
%20Includes%20The%20Following:">cable
kit and then add the fitting for the four-pole 3.5mm connector and a
$10 power brick for it... but I wanted <i>portable</i> operation.

There's a comparison chart of other sound card interfaces <a
href="http://www.westmountainradio.com/products.htm">here and <a
href="http://www.eham.net/reviews/products/53">here. The $80 USB <a
href="http://www.eham.net/reviews/detail/1741http">RigBlaster <a
href="http://www.westmountainradio.com/Image/StoreConfigs/
nomicu_comp_usb.htm">nomic
appears to be the simplest but does require a <a
href="http://www.westmountainradio.com/USB_RIGblasters.htm">USB-serial
adapter as well as a <a
href="http://www.westmountainradio.com/Image/usb_rb1.jpg">tangle of
cables plus an adapter cable for the four-pole Yaesu VX-5 cable.

Here's packet software for sound cards. What have y'all used which works
best when starting with a USB-only laptop, and does adding a dedicated
sound adapter help (and if so, which)?

I would have thought the title would have helped:
Re: Need help: Packet with Yaesu VX-5R HT and no-serial, USB-only notebook
PC

But, I will extract it form the data, and repeat:
What have y'all used (for packet) which works best when starting with a
USB-only laptop, and does adding a dedicated sound adapter help (and if so,
which)?

If you are a US citizen then at least in Brazil you need a valid visa.
Europeans and Canadians generally have less problems. Unless you
are Portuguese and want to enter Paraguay 8-]
A visit to the embassy of the countries you like to travel is a good
idea, otherwise you will run into serious trouble. Many embassies have
web-sites with good info while the prisons are crude and unpleasant.
You will also need a carnet-de-passage for each vehicle.
As for digital modes: South America has fewer resources and so
repeaters of any kind are a lot scarcer than in North-America.
Here in Paraguay e.g. packet radio net is nonexistent.
APRS? About what are you dreaming at night?

Good luck and kind regards, Eike

Hello OM,

happy to see somebody still thinking.

This is something I have been expecting.

Why not to apply first for HF DX-cluster? If no other reason, to get silent
UHF stuff out of the table!

73's
OH3DC / Jouni

whole cloves deep into the meat.
Grease a baking pan, and fill with a thick bed of onions,
   celery, green onions, and parsley.
Place roast on top with fat side up.
Place uncovered in 500� oven for 20 minutes, reduce oven to 325�.
Bake till medium rare (150�) and let roast rest.
Pour stock over onions and drippings, carve the meat and
   place the slices in the au jus.

Bisque � l?Enfant

Honor the memory of Grandma with this dish by utilizing her good
silver soup tureen and her great grandchildren (crawfish, crab or
lobster will work just as well, however this dish is classically
made with crawfish).

Stuffed infant heads, stuffed crawfish heads, stuffed crab or lobster shells;
   make patties if shell or head is not available
   (such as with packaged crawfish, crab, or headless baby).
Flour
oil
onions
bell peppers
garlic salt, pepper, etc.
3 cups chicken stock
2 sticks butter
3 tablespoons oil

First stuff the heads, or make the patties (see index)
   then fry or bake.
Set aside to drain on paper towels.
Make a roux with butter, oil and flour,
   brown vegetables in the roux,

slices of smoked ham, and Gruyere cheese
Flour
eggwash (milk and eggs)
seasoned bread crumbs
1 onion
minced
salt
pepper
butter
olive oil

Pound the breasts flat (parboil first if using umbilical cords so they won?t be tough).
Place a slice of ham and cheese on each, along with some minced onion then fold in half, trimming neatly.
Dredge in flour, eggwash, then seasoned breadcrumbs; allow to sit for a few minutes.
Saut� in butter and olive oil until golden brown, about 6 minutes on each side.

Shish Kababes

As old as the hills, this technique has employed seafood, beef, pork, lamb, poultry, and vegetables; just about anything can be grilled, and young humans are no exception!

High quality marinade (Teriyaki and garlic perhaps)
1 inch cubes of tender meat, preferably from the nursery
Onions
bell peppers
Wooden or metal skewers

Marinate the meat overnight.

Get the grill good and hot while placing meat, vegetables, and
fruit such as pineapples or cherries on the skewers.
Don?t be afraid to use a variety of meats.
Grill to medium rare,
serve with garlic cous-cous and saut�ed asparagus.
Coffee and sherbet for desert then walnuts, cheese, and port.
Cigars for the gentlemen (and ladies if they so desire)!

Crock-Pot Crack Baby

When the quivering, hopelessly addicted crack baby succumbs to death, get him immediately butchered and into the crock-pot, so that any remaining toxins will not be fatal. But don?t cook it too long, because like Blowfish, there is a perfect medium between the poisonous and the stimulating. Though it may not have the same effect on your guests, a whole chicken cooked in this fashion is also mighty tasty.

1 newborn - cocaine addicted, freshly expired, cleaned and butchered
Carrots
onions
leeks
celery
bell pepper
potatoes
Salt
pepper
garlic, etc
4 cups wa

with cloves.
Bake uncovered in 350� oven till thermometer reaches 160�.

Cajun Babies

Just like crabs or crawfish, babies are boiled alive!
You don?t need silverware, the hot spicy meat comes off in your hands.

6 live babies
1 lb. smoked sausage
4 lemons
whole garlic
2 lb. new potatoes
4 ears corn
1 box salt
crab boil

Bring 3 gallons of water to a boil.
Add sausage, salt, crab boil, lemons and garlic.
Drop potatoes in, boil for 4 minutes.
Corn is added next, boil an additional 11 minutes.
Put the live babies into the boiling water and cover.
Boil till meat comes off easily with a fork.

Oven-Baked Baby-Back Ribs

Beef ribs or pork ribs can be used in this recipe,
and that is exactly what your dinner guests will assume!
An excellent way to expose the uninitiated to this highly misunderstood
yet succulent source of protein.

2 human baby rib racks
3 cups barbecue sauce or honey glaze (see index)
Salt
black pepper

white pepper
paprika

Remove the silverskin by loosening from the edges,
   then stripping off.
Season generously, rubbing the mixture into the baby?s flesh.
Place 1 quart water in a baking pan, the meat on a wire rack.
Bake uncovered in 250� oven for 1� hours.
When browned, remove and glaze,
   return to oven and bake 20 minutes more to form a glaze.
Cut ribs into individual pieces and serve with extra sauce.

Fresh Sausage

If it becomes necessary to hide the fact that you are eating
human babies, this is the perfect solution.
But if you are still paranoid, you can substitute pork butt.

5 lb. lean chuck roast
3 lb. prime baby butt
2 tablespoons each:
   salt
   black, white and cayenne peppers
   celery salt
   garlic powder
   parsley flakes
   brown sugar
1 teaspoon sage
2 onions
6 cloves garlic
bunch green onions, cho

� stick butter
1 cup cooked pasta (macaroni, shells, etc.)

Remove as much meat as possible, cube, and brown in hot oil.
Add a little water, season, then add the carcass.
Simmer for half an hour keeping the stock thick.
Remove the carcass and add the vegetables slowly to the stock,
   so that it remains boiling the whole time.
Cover the pot and simmer till vegetables are tender
   (2 hours approximately).
Continue seasoning to taste.
Before serving, add butter and pasta,
   serve piping with hot bread and butter.

Offspring Rolls

Similar to Vietnamese style fried rolls, they have lots of meat
(of course this can consist of chicken, beef, pork, or shrimp).
Who can resist this classic appetizer; or light lunch served with
a fresh salad? Versatility is probably this recipe?s greatest virtue,
as one can use the best part of a prime, rare, yearling, or the
morticians occasional horror: a small miracle stopped short by a
drunk driver, or the innocent victim of a drive-by shooting...

2 cups finely chopped very young h

vegetables.
   Put the meat back into the wok and adjust the seasoning.
   De-glaze with sherry, cooking off the alcohol.
   Add broth (optional) cook a few more minutes.
   Add the cornstarch, cook a few minutes till thick,
      then place the stuffing into a colander and cool;
   2 hours
Wrap the rolls:
   Place 3 tablespoons of stuffing in the wrap, roll tightly -
      corner nearest you first, fold 2 side corners in,
      wrap till remaining corner is left.
   Brush with egg, seal, and allow to sit on the seal for
   a few minutes.
Fry the rolls:
   325� if using egg roll wraps, 350� for spring roll wraps.
   Deep fry in peanut oil till crispy golden brown, drain on paper towels.

Lemon Neonate

Turkey serves just as well, and in fact even looks a bit like a well-dressed baby. By the time you turn the child?s breast into cutlets, it will be indistinguishable. The taste of young human, although similar to turkey (and chicken) often can be wildly different depending upon what he or she has consumed during its 10 to 14 months of life...

4 well chosen cutlets (from the breasts of 2 healthy neonates)
2 large lemons (fresh lemons always, if possible)

```

```

Tie with butcher string around and across so that he looks like
he?s crawling.
Glaze, then arrange pineapples and secure with cloves.
Bake uncovered in 350� oven till thermometer reaches 160�.

Cajun Babies

Just like crabs or crawfish, babies are boiled alive!
You don?t need silverware, the hot spicy meat comes off in your hands.

6 live babies
1 lb. smoked sausage
4 lemons
whole garlic
2 lb. new potatoes
4 ears corn
1 box salt

crab boil

Bring 3 gallons of water to a boil.
Add sausage, salt, crab boil, lemons and garlic.
Drop potatoes in, boil for 4 minutes.
Corn is added next, boil an additional 11 minutes.
Put the live babies into the boiling water and cover.
Boil till meat comes off easily with a fork.

Oven-Baked Baby-Back Ribs

Beef ribs or pork ribs can be used in this recipe,
and that is exactly what your dinner guests will assume!
An excellent way to expose the uninitiated to this highly misunderstood
yet succulent source of protein.

2 human baby rib racks
3 cups barbecue sauce or honey glaze (see index)
Salt
black pepper
white pepper
paprika

Remove the silverskin by loosening from the edges,
   then stripping off.
Season generously, rubbing the mixture into the baby?s flesh.
Place 1 quart water in a baking pan, the meat on a wire rack.
Bake uncovered in 250� oven for 1� hours.
When browned, remove and glaze,
   return to oven and bake 20 minutes more to form a glaze.
Cut ribs into individual pieces and serve with extra sauce.

Fresh Sausage

If it becomes necessary to hide the fact that you are eating
human babies, this is the perfect solution.
But if you are still paranoid, you can substitute pork butt.

5 lb. lean chuck roast
3 lb. prime baby butt
2 tablespoons each:
   salt
   black, white and cayenne peppers
   celery salt
   garlic powder
   parsley flakes
   brown sugar
1 teaspoon sage
2 onions

```
6 cloves garlic
b

perhaps)
1 inch cubes of tender meat, preferably from the nursery
Onions
bell peppers
Wooden or metal skewers

Marinate the meat overnight.
Get the grill good and hot while placing meat, vegetables, and
   fruit such as pineapples or cherries on the skewers.
Don?t be afraid to use a variety of meats.
Grill to medium rare,
   serve with garlic cous-cous and saut�ed asparagus.
Coffee and sherbet for desert then walnuts, cheese, and port.
Cigars for the gentlemen (and ladies if they so desire)!
```

Crock-Pot Crack Baby

When the quivering, hopelessly addicted crack baby succumbs to death, get him immediately butchered and into the crock-pot, so that any remaining toxins will not be fatal. But don?t cook it too long, because like Blowfish, there is a perfect medium between the poisonous and the stimulating. Though it may not have the same effect on your guests, a whole chicken cooked in this fashion is also mighty tasty.

1 newborn - cocaine addicted, freshly expired, cleaned and butchered
Carrots
on

as stew, lasagna, or meat loaf.

Some suggestions

Pre-mie pot pies, beef stew, leg of lamb, stuffed chicken, roast pork spiral ham,
Cranberry pineapple salad, sweet potatoes in butter, vegetable platter, tossed salad with tomato and avocado, parsley new potatoes, spinich cucumber salad, fruit salad
Bran muffins, dinner rolls, soft breadsticks, rice pilaf, croissants
Apple cake with rum sauce, frosted banana nut bread sherbet, home made brownies

Iced tea, water, beer, bloody marys, lemonade, coffee

The guests select food, beverages, silverware... everything from the buffet table. They move to wherever they are comfortable, and sit with whoever they choose. Provide trays so your guests will not spill everything all over your house from carrying too much, nor will they have to make 10 trips back and fourth from the service stations.

Roast Leg of Amputee

By all means, substitute lamb or a good beef roast if the haunch
it is in any way diseased. But sometimes surgeons make mista

of abortion clinics
thrive and hot French bread is always available.

2 cleaned fetuses, head on
2 eggs
1 tablespoon yellow mustard
1 cup seasoned flour
oil enough for deep frying
1 loaf French bread
Lettuce
tomatoes
mayonnaise, etc.

Marinate the fetuses in the egg-mustard mixture.
Dredge thoroughly in flour.
Fry at 375� until crispy golden brown.
Remove and place on paper towels.

Holiday Youngster

One can easily adapt this recipe to ham, though as presented,
it violates no religious taboos against swine.

1 large toddler or small child, cleaned and de-headed
Kentucky Bourbon Sauce (see index)
1 large can pineapple slices
Whole cloves

Place him (or ham) or her in a large glass baking dish, buttocks up.
Tie with butcher string around and across so that he looks like he?s crawling.
Glaze, then arrange pineapples and secure with cloves.
Bake uncovered in 350� oven till thermometer reaches 160�.

Cajun Babies

Just like crabs or crawfish, babies are boiled alive!
You don?t need silverware, the hot spicy meat comes off in your hands.

6 live babies
1 lb. smoked sausage
4 lemons
whole garlic
2 lb. new potatoes
4 ears corn
1 box salt
crab boil

Bring 3 gallons of water to a boil.
Add sausage, salt, crab boil, lemons and garlic.
Drop potatoes in, boil for 4 minutes.
Corn is added next, boil an additional 11 minutes.

Put the live babies into the boiling water and cover.
Boil till meat comes off easily with a fork.

Oven-Baked Baby-Back Ribs

Beef ribs or pork ribs can be used in this recipe,
and that is exactly what your dinner guests will assume!
An excellent way to expose the uninitiated to this highly misunderstood
yet succulent source of protein.

2 human baby rib racks
3 cups barbecue sauce or honey glaze (see index)
Salt
black pepper
white pepper
paprika

Free quick easy money Amazing !!!!!!!!!!!!
Date: 22 Dec 04

Comments

HOW TO TURN $6 INTO $6,000!!!!!! READING THIS COULD CHANGE YOUR LIFE! I found this on a bulletin board and decided to try it. A little while back, I was browsing through newsgroups, just like you are now, and came across an article similar to this that said you could make thousands of dollars within weeks with only an initial investment of $6.00! So I thought, Yeah right, this must be a scam,but like most of us, I was curious, so I kept reading. Anyway, it said that you send $1.00 to each of the 6 names and address stated in the article. You then place your own name and address in the bottom of the list at #6, and post the article in at least 200 newsgroups. (There are thousands) No catch, that was it. So after thinking it over, and talking to a few people first, I thought about trying it. I figured: what have I got to lose except 6 stamps and $6.00, right? Then I invested the measly $6.00. Well GUESS WHAT!!... within 7 days, I started getting money in the mail! I was shocked! I figured it would end soon, but the money just kept coming in. In my first week, I made about $25.00. By the end of the second week I had made a total of over $1,000.00! In the third week I had over $10,000.00 and it's still growing. This is now my fourth week and I have made a total of just over $42,000.00 and it's still coming in rapidly. It's certainly worth $6.00, and 6 stamps, I have spent more than that on the lottery!! Let me tell you how this works and most importantly, why it works....Also, make sure you print a copy of this article NOW, so you can get the information off of it as you need it. I promise you that if you follow the directions exactly, that you will start making more money than you thought possible by doing something so easy! Suggestion: Read this entire message carefully! (print it out or download it.) Follow the simple directions and watch the money come in! It's easy. It's legal. And, your investment is only $6.00 (Plus postage) IMPORTANT: This is not a rip-off; it is not indecent; it is not illegal; and it is virtually no risk - it really works!!!! If all of the following instructions are adhered to, you will receive extraordinary dividends. PLEASE NOTE: Please follow these directions EXACTLY, and $50,000 or more can be yours in 20 to 60 days. This program remains successful because of the honesty and integrity of the participants. Please continue its success by carefully adhering to the instructions. You will now become part of the Mail Order business. In this business your product is not solid and tangible, it's a service. You are in the business of developing Mailing Lists. Many large corporations are happy to pay big bucks for quality lists. However, the money made from the mailing lists is secondary to the income which is made from people like you and me asking to be included in that list. Here are the 4 easy steps to success: STEP 1: Get 6 separate pieces of paper and write the following on each piece of paper;PLEASE PUT ME ON YOUR MAILING LIST. Now get 6 US $1.00 bills and place ONE inside EACH of the 6 pieces of paper so the bill will not be seen through the envelope (to prevent thievery). Next, place one paper in each of the 6 envelopes and seal them. You should now have 6 sealed envelopes, each with a piece of paper stating the above phrase, your name and address, and a $1.00 bill. What you are doing is creating a service. THIS IS ABSOLUTELY LEGAL! You are requesting a legitimate service and you are paying for it! Like most of us I was a little skeptical and a little worried about the legal aspects of it all. So I checked it out with the U.S. Post Office (1-800-725-2161) and they confirmed that it is indeed legal! Mail the 6 envelopes to the following addresses:

#1)Randall Hines 22 Stature Dr. Newark
DE 19713

#2) Mike Sharrer 921 West State St. Coopersburg PA 18036

#3) Jeffrey Hyun 17414Stark Ave Cerritos,CA 90703

#4) James Adair the third 22 Over Rd. Feasterville PA 19053

#5) TSR Solutions 15907 Golden Eye CT Parker CO 80134

#6) Daryl L. 6063 Roosevelt Blvd Apt# 216 Philadelphia PA 19149

STEP 2: Now take the #1 name off the list that you see above, move the other names up (6 becomes 5, 5 becomes 4, etc...) and add YOUR Name as number 6 on the list. STEP 3: Change anything you need to, but try to keep this article as close to original as possible. Now, post your amended article to at least 200 newsgroups. (I think there are close to 24,000 groups) All you need is 200, but remember, the more you post, the more money you make! This is perfectly legal! If you have any doubts, refer to Title 18 Sec. 1302 & 1341 of the Postal lottery laws. Keep a copy of these steps for yourself and, whenever you need money, you can use it again, and again. PLEASE REMEMBER that this program remains successful because of the honesty and integrity of the participants and by their carefully adhering to the directions. Look at it this way. If you are of integrity, the program will continue and the money that so many others have received will come your way. NOTE: You may want to retain every name and address sent to you, either on a computer or hard copy and keep the notes people send you. This VERIFIES that you are truly providing a service. (Also, it might be a good idea to wrap the $1 bill in dark paper to reduce the risk of mail theft.) So, as each post is downloaded and the directions carefully followed, six members will be reimbursed for their participation as a List Developer with one dollar each. Your name will move up the list geometrically so that when your name reaches the #1 position you will be receiving thousands of dollars in CASH!!! What an opportunity for only $6.00 ($1.00 for each of the first six people listed above) Send it now, add your own name to the list and you're in business! ---DIRECTIONS ----- FOR HOW TO POST TO NEWSGROUPS------------ Step 1) You do not need to re-type this entire letter to do your own posting. Simply put your cursor at the beginning of this letter and drag your cursor to the bottom of this document, and select 'copy' from the edit menu. This will copy the entire letter into the computer's memory. Step 2) Open a blank 'notepad' file and place your cursor at the top of the blank page. From the 'edit' menu select 'paste'. This will paste a copy of the letter into notepad so that you can add your name to the list. Step 3) Save your new notepad file as a .txt file. If you want to do your postings in different settings, you'll always have this file to go back to. Step 4) Use Netscape or Internet explorer and try searching for various newsgroups (on-line forums, message boards, chat sites, discussions.) Step 5) Visit these message boards and post this article as a new message by highlighting the text of this letter and selecting paste from the edit menu. Fill in the Subject, this will be the header that everyone sees as they scroll through the list of postings in a particular group, click the post message button. You're done with your first one! Congratulations...THAT'S IT! All you have to do is jump to different newsgroups and post away, after you get the hang of it, it will take about 30 seconds for each newsgroup! **REMEMBER, THE MORE NEWSGROUPS YOU POST IN, THE MORE MONEY YOU WILL MAKE!! BUT YOU HAVE TO POST A MINIMUM OF 200** That's it! You will begin receiving money from around the world within days! You may eventually want to rent a P.O.Box due to the large amount of mail you will receive. If you wish to stay anonymous, you can invent a name to use, as long as the postman will deliver it. **JUST MAKE SURE ALL THE ADDRESSES ARE CORRECT.** Now the WHY part: Out of 200 postings, say I receive only 5 replies (a very low example). So then I made $5.00 with my name at #6 on the letter. Now, each of the 5 persons who just sent me $1.00 make the MINIMUM 200 postings, each with my name at #5 and only 5 persons respond to each of the original 5, that is another $25.00 for me, now those 25 each make 200 MINIMUM posts with my name at #4 and only 5 replies each, I will bring in an additional $125.00! Now, those 125 persons turn around and post the MINIMUM 200 with my name at #3 and only receive 5 replies each, I will make an additional $626.00! OK, now here is the fun part, each of those 625 persons post a MINIMUM 200 letters with my name at #2 and they each only receive 5 replies, that just made me $3,125.00!!! Those 3,125 persons will all deliver this message to 200 newsgroups with my name at #1 and if still 5 persons per 200 newsgroups react I will receive $15,625,00! With an original investment of only $6.00! AMAZING! When your name is no longer on the list, you just take the latest posting in the newsgroups, and send out another $6.00 to names on the list, putting your name at number 6 again. And start posting again. The thing to remember is: do you realize that thousands of people all over the world are joining the internet and reading these articles everyday?, JUST LIKE YOU are now!! So, can you afford $6.00 and see if it really works?? I think so... People have said, &quote;what if the plan is played out and no one sends you the money? So what! What are the chances of that happening when there are tons of new honest users and new honest people who are joining the internet and newsgroups everyday and are willing to give it a try? Estimates are at 20,000 to 50,000 new users, every day, with thousands of those joining the actual internet. Remember: play FAIRLY and HONESTLY and this will really work.

I just upgraded to digipan 2.0 and now find that I can't get the program
to run.  Every time I attempt to execute it, I get a dialog box
reporting an illegal operation and the application aborts.  I deleted
the .ini file prior to the upgrade as the instructions note.
Additionally, I now find that my old trusty Hamscope fails to load as
well and I get the same dialog box on launching it.  Anybody know what
gives here??  I'm anxious to get back on the air with these apps.

What OS are you running? How much RAM etc?
Maybe upgrade your system, more RAM can do wonders and a 256 Meg stick
is not that expensive these days.

Last couple evenings heard on 3584 a digital mode that sounds and
looks like MFSK on the waterfall except the bandwidth is 1000 hz. None
of my various programs will decode it. Anyone have a clue as to what
it may be and what SW is available to use it. TIA Nigel VE3ELQ

Nigel maybe compare it to the digital on-line sounds at these URL's
http://www.wunclub.com/sounds/

http://www.kb9ukd.com/digital/

http://rover.wiesbaden.netsurf.de/~signals/DIG_intro.htm

Good Luck

There is a new mode being experimented with - I've seen it discussed
in the Yahoo groups digitalradio and mfsk. Haven't tried it yet myself.

It's called "Olivia." It's a MFSK variant with multiple tones and bandwidth
settings which are currently user selectable The default setup is 32 tones
with a bandwidth of 1000Hz. The mode uses forward error correction allowing
weak signal reception. The made is being developed by Pawel Jalocha,
SP9VRC.

I wonder why anyone is messing with these modes instead of doing DSSS, now that we can digitally-process the daylights out of the received signal instead of messing with analog filter banks or whatever. I've been hoping for something even slower than PSK31, spread over an entire ham band or even multiple bands. I'd think something like that would be ultra-reliable through just about any amount of interference.

DSSS is nowhere near the best modulation format in the presence of narrowband interference. OFDM is far better suited in this case as was shown in ADSL trials (examing the effects of cable crosstalk). We found the same during our amateur spread specturm experiments in Dallas in the 902-928 MHZ band in the late 1990s where DSSS was far inferior to frequency hopping with bad channel notching.

I was thinking in terms of DSSS on the HF bands, for reliable, long haul data traffic at very low bit rates. Am I nuts?

Well, if anyplace has severe narrowband interference, I would think that
HF would surely be it.

Here's a way to get reliable, long haul data traffic at low bit rates:

http://www.uspacket.org/plan_a.htm

You probably can try
http://www.ScienceOxygen.com/design208.html

It does not sell anything there. It is just
a collection of links about DSP. Probably you can
start from there to collect some information...

I had scoured the net for cheaper 13cm (2.3-2.6 GHz) widecoverage
receiver with fine adjustable stepping LCD controller.

So far, had only found these 2 main suppliers at http://www.13cm.co.uk
and http://www.g1mfg.com which both is UK based.

G1MFG products look good but expensive, while 13cm's were cheap but
crude (required DIY connections).

Is there cheaper alternative, or better, ready-made (minimal
construction required) which LCD controller built-in?

I believe that since the main radio components are supplied by
Taiwanese company, Comtech, there should be more similar products
around the world, or at least, "clones".

Any good recommendation?

Thank you.

Regards,
Kevin

If you're not up to hooking up a LCD controller and a receiver then
your only real option is a videosender receiver.

Chris

Hello All,

A general aviation pilot friend of mine brought me a wattmeter with an adjustment between the wattmeter and the swr meter. It ranges between 0 and 10. The only marks of identification are Mura CBM-30. So my questions are..

1. What is the darn adjustment for?

2. What frequency range is for? VHF would be ideal...

Thanks in advance for any information,
Chris

Greetings

Yes, I still have my old pre-286 computer...

I was on packet radio using my then quite acceptable pre-286 computer... however when I got my present pentium 100 I retired my pre-286....I also retired from packet... a move a currently regret...

Anyways I retired about a year and a half ago and one of my retirement wants was to get back onto packet....

Recently I have heard that packet is not what it used to be.... but be that as it may...

Today I finally got my old pre-286 computer out of the closet and connected up my old monitor... got found the old keyboard and connected the three together...

I connected the keyboard in.... turned on the monitor and turned on the computer....

As the computer went through it's various diagnostics I began to feel better and better...

However... I have either forgotten something or something is wrong.. and this is why I am sending this message...

The cursor appears on a line by itself...

I have either forgotten too much or something is wrong...

After pacing around trying to remember what I used to do next, I typed in dir:

the computer came back   syntax error....

more thinking   and I typed in dir c: (enter)

again the computer came back syntax error....

am I doing something wrong or is there a problem that time has given me?....

Larry ve3fxq

Hello all,

A few gentlemen in my area are considering building/setting up a wireless network in our local area. We plan on using the OTC 802.11 equipment. What conserns me is that if we use the part 97 power we must ID every ten minutes. Is there any software available that does this automaticly?

I am guessing that if we send text messages we can simply add the call to it; or say the call when using voice and video.

Thanks in advance for any and all information,
Chris

With respect, I disagree.

Anonymity can benefit a debate more than it detracts: it relieves a poster of the externalities that blunt honesty and originality so badly wanting in many discussions on Usenet, and being recognized seduces some to sink to mean-spirited sarcasm when they're afraid to make a controversial point or defend an unpopular opinion.

With the entire world able to read my words, and with a mind to the ever-increasing power of corporations to dictate their employees' actions outside the workplace, I choose to be "anonymous" for purposes of Usenet posting.

That doesn't mean I'm not responsible for what I write: my ISP and any policeman can find my "true" identity quickly and easily. That doesn't mean I don't stand behind my words: I defend my opinions with the same vigor I apply to arguments using my "real" name.

What it means is that the reader must consider what I write without knowing who I 'really' am: in other words, (s)he must evaluate my postings and decide if they are worthwhile solely on the merit of what I write, without reference to the boatload of baggage I bring to any contest where my pedigree is advertised in advance.

That's not a bad thing. It means that the debate is focused on the issue at hand, and much less likely to be sidetracked or sabotaged by persons it makes uncomfortable. Especially in this political season, we've all seen what happens when some "heavyweight" arrogates acceptance of an opionion or 'fact' that doesn't deserve consideration or which begs for disproval, often with a hidden agenda having little or nothing to do with the argument's basis.

Moreover, the reputation I build on Usenet, even using a different name than the one inscribed on my mailbox, is still a reputation, and still carries with it the accumulated weight of my past writings. Eric Blair, David Cornwell, and Samual Langhorne Clemens all made indelible impressions on the litterary world using assumed names: in these and many other cases, their 'real' identities became a minor footnote to their accomplishments under their 'false' names. I do not, sad to say, expect to be in their company anytime soon, but one can always dream, and my dream is that I can assend over the limitations often associated with persons of my upbringing and education, to make a meaningful difference in others' lives, if only via encouraging them to think for themselves.

FWIW. YMMV.

William

I seem to have a problem with having two radios. One is dedicated to APRS and will start operating when I turn on the ignition. The other is a normal 2 meter mobile. When I key the 2 meter mobile it drives the APRS mobile nuts. I am thinking I need a sharp band pass filter or duplexer. What is everyone else doing about this problem? Or am I the only one with two radios?

Hi,
Does anyone have the schematic for hooking up the mfj tnc to a motorolla
mocom 70 radio?  Mine is connected this way but I have lost the schematics.

Thanks

Can anyone tell me where I might download this program ?? Or, if anyone has it on a floppy, would you sell it , or send it to me via email ?

I have done a LOT of Google searching, but cannot find a place to download this, although I thought it would be fairly easy to find.

I will appreciate any help !!

73 de Jim K4PYT

open the box up and you may find a jumper in-side that will clear the memory!

I have two radios, and the APRS radio running about 25 w out does desense the other 2m radio for a second every couple minutes. The laptop and TNC also cause some noise problems. I'm sure the APRS radio is desensed when I talk on the other 2m radio, but it is something I can live with.

It would take some really good filters to help much, and probably not practically possible.

I'm trying to get two basic stamps (or one stamp and a computer) to communicate via amateur radio. The stamp and the computer/other stamp will be about 10 miles apart. I want to use a basic stamp as a security device that will send data when told to do so by the other device. Can anyone point me in the right direction? I can explain further if needed. Thanks!

dw

That was kind of my knee-jerk reaction, but it's kind of the high priced approach.

However, QST, this month or last, had a simple PIC-based APRS lashup. One could probably take that circuit, rip out the GPS software and replace it with something for dw's sensors on the remote end.

One the PC end, the AGW packet engine makes a cheap TNC.

Of course, thinking over it again ... if dw is spending all those dollars on Basic Stamps, then a couple of TNC's shouldn't be a big yank.

Hi everyone,
    We are students at the University of Kansas trying to setup tcp/ip
over ax25 between two linux (Debian) boxes.

Each box is connected to a 2m radio (144.42 MHz) and a 1200 bps tnc.
they are in the same room.

Both linux boxes have ax.25 appls, tools and libraries installed and
have the kernel appropriately configured. We use the kissattach
command to create kiss network (ax0) interfaces and are trying to
establish the TCP/IP network between them.

While, ping works (around 50% loss), ssh (axssh client) is not
working. It just hangs. We were wondering if the high packet loss is
causing this.

We would appreciate if someone with more experience in using SSH over
AX.25 could help us out.

Thanks in advance,
Sriram

Have you tried adjusting txdelay and possibly txtail (using kissparms)?

The default ping interval is one second. You may need to increase this
(ping -i 2).

Do ftp and smtp also have problems?

I haven't tried SSH over AX.25, but, but at one time it was pretty
clear that it was not permitted by Part 97, because it obscured the
meaning of a transmission. There were some extensive revisions to the
rules a few years ago and this may have changed.

73, Bob N7XY

Greetings!

I'm trying to get up and running with a couple of the soundcard-based digital transceive programs. I am running the audio output from my computer to the six-pin data port on the rear of my IC-706 (pin 1, data in). No matter how I configure the audio settings on my computer, I cannot get any signal to transmit. I tried both VOX and manual keying to turn on the transmitter, but no power goes out. When I disconnect the plug from the audio output jack on my computer, I can hear the SSTV warbling very clearly, but it isn't making it out of the transmitter. I've seen it recommended that an audio transformer be inserted between computer and radio as an isolator, but it's also stated that it's only to give clear tones.

Any suggestions? Many thanks in advance!

Jeff, WK3U

Six-pin data port?

That's a data port -- not audio, hence no power out.

Use either the 13 pin accessory connector or the RJ45 -- either will work.

Thanks Xpyttl!

The diagram isn't very clear on the 13 pin port. Would that be pin 11 for
analog input and pin 2 for ground?

Thanks again! 73

That would be correct. You get AF out of your soundcard. For receive, you can take the AF from that connector to the soundcard. If I recall, this is independent of the volume control which is pretty nice. You get tired of hearing the squawk from the digital modes pretty quick.

Be careful of bridging some of those other pins. One of them is a supply, 8 volts I think. If you take it to ground there is an internal fuse that will go. It's an easy replace, but it's kind of a sinking feeling when the radio won't power up! The pins on that 13 pin DIN are mighty close.

Hi Bob,
>
> Have you tried adjusting txdelay and possibly txtail (using kissparms)?

We tried varying the values. But it did not make significant difference in the error rate or the ssh connection.
>

> The default ping interval is one second. You may need to increase this
> (ping -i 2).
>
> Do ftp and smtp also have problems?

We tried telnet. Telenet is able to connect sometimes, not all the time.

Yes. SSH over AX.25 is allowed now.

Thanks,
Sriram

Sriram

Okay you have to tackle this problem by layers. reading what you have wrote implies to me that a layer lower than that you see the trouble with is causing the problem. (The OSI 7 layer model is something to look at but you probably wont find any reference to amateur radio packet)

I'd suspect the radio link/freq/modulation depth etc.

Keep in mind that TCP/IP over radio is slow and if you are doing tests you must allow for this. Dont fill up the outbound buffer with data! TCP/IP for LANs is a lot faster than radio so the RTT discovery will put a flood of packets onto the interface when you first start a connection. This will only confuse the problem.

You tried doing a ping test and Bob N7XY suggested increasing the wait time. Also increase the length of the packet (bytes) up to the interface MTU. This will prove if the RF path is flakey. (signal strength, modulation depth/deviation, same frequency etc) ie if you have a 1 in 40 bit error it is going to show up in far less packets of shorter length than of longer ones. If the signal strength is good I'd be upset if I was losing more than 5% of the packets. (This is why you use a much shorter packet length on HF radio as there is more likelihood of a packet error)

Get the above worked out with pings until you even look at anything TCP (eg SSH/FTP)

I use to adjust the TXdelay and TXtail by running a continuous long packet ping and changing them dynamically. When the errors starting happening I would back it off one notch. You can also do the same thing with setting deviation and adjusting freqeuency but it is better starting with RF/radio tests with suitable test equipment first.

Cheers Bob VK2YQA

I posted about rpoints a while ago - well it seems you can get money just for posting!

You get �5 for going to register at www.rpoints.com/register (I understand you have to use this link else you don't get anything - I get NO referral bonus)

Then if you go onto the forums you can post offes which are linked to the rpoints partners and if ANYBODY buys stuff via the offers then YOU get a proportion of the cash.

I'm gonna try this myself.

I have the TNC-to-radio cabling up and working....TX,RX,etc seems to be
working OK.......BUT.........I can't get the data to come up on the computer
screen....the KPC-3 has a DB25 and the Computer has a DB9 for the Comm Port
& I'm using a standard RS-232 cable with a DB9 on one end and a DB25 on the
other.........someone suggested using a Modem Cable.........will that work?
Thanks,
Butch k4nau

...
| Yes. SSH over AX.25 is allowed now.

Eh? I assume you're explicitly turning off the encryption?

(Do any modern versions of ssh let you disable the encryption anymore?
OpenSSH doesn't seem to ... ssh -c none doesn't do it.)

With the encryption enabled, I don't see how ssh usage over a ham link
of any sort could ever be legal (at least under part 97 rules.) Even
with it disabled, I'd expect there to still be some encryption going
on in the authentication part of the connection, and I'd expect that
to make it illegal.

I've found a brilliant method of getting the best price and getting the best cashback - and it's foolproof.

You first of all have to register with www.rpoints.com/register (it's my fave site and they give you �5 just for joining if you are a new member).

Look around all the rpoints partners and you can buy anything and get the best price and rpoints will give you cashback.

But THAT'S NOT ALL!!

If you pay with Barclaycard (for your good when you are on rpoints) then Barclaycard will give you the money back if you can find the item cheaper anywhere instore or on the net and EVEN IN THE SALES - up to 60 days after you buy the product. This is not a joke - the only stipulation is that the item must be branded and be over �50 in value (look on the BC website for more details if you are unsure).

BUT ... this is the best bit. The trick is (if that's not good enough already) buy the item via rpoints at the HIGHEST possible price (yes, I mean it) - then you get the HIGHEST CASHBACK from rpoints. Then you'll easily find the product cheaper and barclaycard will give you the difference between the high price you paid and the lowest price you can find. The only real caveat here is that you have to ensure that you apply for the BC price promise and not sit around for 60 days doing nothing!

It's easy - start at www.rpoints.com/register and get your free �5 as a sweetner!

Are you getting anything at all, even gobbledygook ?

If you are then it's probably just your baud rate or stop/start bits. If you are getting nothing at all then yes, try a new cable. Data cables and modem cables have different wiring (pins 2, and 3 are swapped over), so try a new cable. It's sooo long since I bought one, I don't actually remember which you need ;-)

If you are stuck I'll bell out the one I use here and tell you.

I'm running KPC-3 quite happily on an old 386 laptop with paket 6.2

Have you tried a hard reset on it ?

I have a manual in emailable form if it's required.

Everyone should have a radio station!

Okay so I downloaded this shit that said "shareware" and, long story short, after a long instalation they expect me to register and pay them per month *per* *listener*!

I'm sure there's someone here who knows how to do live audiostream from my pc to my server through ftp for free.... help? Can I just play tracks from Media Player and have it listenable from my site?

I picked up an old PacComm TNC-220 with V3.0 firmware.

I'm trying to get it to talk with XASTIR on a Sparc Ultra2 with dual 300Mhz processors and 1G of RAM running Aurora Linux. I can get the TNC to talk to the computer using MINICOM, but for some reason XASTIR bombs when trying to talk to it.

Anyone have any clues as to what's going on here? XASTIR and the PacComm TNC are both new to me. The hardware and OS aren't.

Thanks, and 73 de AI8W, Chris

I know.. bad form to reply to your own message.... but...

I fixed it.. Idiot me should have read the install docs... I forgot to
SUID the executable so it could access the serial port.

Thanks for reading.

I am a student in an embedded systems design class. I am planning a project where I'll get two 8051-microcontroller-based development boards with 433 MHz FM transceivers to talk to each other. Each development board will be connected via RS-232 to a computer running terminal software. My initial goal is to be able to send some keystrokes back and forth between the two systems.

The real challenge of the project is in developing my own wireless protocol to handle packetization, start and stop codes, error detection and correction, line coding, and perhaps collision handling. I am looking for a good tutorial on how to go about such a task--i.e. what options are available and guidelines for implementing them. Something on the web or a book would both be good. I was wondering if you might be able to make a recommendation.

Additionally, if you would please recommend any existing protocols that would be sufficient for my application, this would be very helpful because: a) I can use the existing protocol as a reference when developing my own and b) If it turns out to be too difficult to develop my own, I can switch my goal to implementing the existing protocol.

I would be very grateful for any assistance that you might be able to provide. Thanks so much for your help.

Dude, do your own research :-)

I ordered these from www.futurlec.com:

 http://www.futurlec.com/Radio.shtml

Good stuff for hobby projects.

 S.

The two that amateurs use are x25 and tcpip. The ham radio implemetation of x25 (ax25) is what is used in packet radio. It is well documented in all communication layers. Tcpip is well documented in the internet rfc and other docs, though I don't remember seeing any timing specs like are included in x25.

Do a google search on "serial transfer protocol". You will get about 500,000 hits.

Initially look for the standard terminal communication protocol. That already has some form of packetization, start and stop codes, error detection and correction. It's relatively simple so you can expand from there.

Didn't the supplier of the transceivers give you any application guidelines?

Unfortunately, they didn't.

I'd like to thank all of you who have replied to this post for all of
your assistance.  I have a strong desire to learn about wireless, but
unfortunately I took on a risk in doing so in that I've ventured
outside of the realm of my Professor's expertise and it's up to me to
figure it all out on my own.  I am really hoping that the resources
you have suggested will be sufficient to enable me to get the job
done.  If anyone else has anything to contribute, I would really
appreciate it.  Thanks to you all...

Although a ham since 1967, I'm having my arm twisted to rustle up
something similar for (legal) data channels on licence free UHF CB
radio. Here in NZ, & no doubt globally, these PRS/FRS ~470MHz 2 way
radios are insanely cheap, (<US$30) yet have great range -managed an
easy link across 6 miles of harbour with a pair. I'm calling the quest
"KISS & tel" - for simple wireless telemetry - & will probably go for
AFSK (Audio Freq Shift Keying).

Instead of Basic Stamps,we'll be using the powerful PICAXE micros,
since they've achieved near cult status downunder & are ~ 1/10th the
same BS price.
See the likes of => www.picaxe.orcon.net.nz or => www.picaxe.com

Here is a free and open protocol... http://www.hth.com/snap/

You should learn why preambles are used when dealing with wireless protocols. Circuit Cellar magazine (http://www.circuitcellar.com/) had an article by Jeff Bachiochi about this in their July, 2001 (#132) issue. I couldn't find the article on the Web, but you might be able to get a reprint from the magazine. It is very informative.

Good luck in your project.

John

You may want to take this in small pieces. Get a little bit working, then
add some
additional functions. That way you have at least something to show for a
project
if the entire effort turns out to be much larger than you thought.

Think about the most basic things first:
    How do you turn the transmitter on and off?
    How does the receiver know if it is receiving a signal?

Since you have an RS-232 connection between each radio and it's computer,
and
are using an ASCII terminal, how do you use ASCII codes to tell the radios

what to do, as opposed to telling the radio what data to send?

Next thing to think about:
How do you send control codes over the radio link?
How do you distinguish data you want to send over the link from control
information you want to send over the link?

I think if you figure out just this much you will have a sucessful project.

You have to have the specs of the TXRX boards and the IO. You can use x
modem or y modem or z modem or several gernic file transfer protocols,
kermit, just to get going. why write all that code, and figure out the
timing. and fine tune it later

Hi all,
I desperately need help in hooking a KAM TNC 5.01 to an ICOM 706. What I
need to know is what color from the ACC. plug gets connected to what color
wire on the TNC HF cable. I've tried deciphering both manuals but have gone
goofy eyed!
All I want to do is run RTTY, CW and AMTOR on HF. I know this is hard
relating this to me this way but any help would be greatly appreciated.
Thanks
Barry KA9MAT Ashford, WI.

I agree that a good way to start is with, e.g., XModem, since the original poster apparently has a 'virtual RS-232' connection between the transmitter and receiver going already. In fact, getting XModem or similar working should be sufficient for his project.

However, for 'real world' applications, you need to encapsulate the data in a much more robust encoding scheme -- at least if you need to go 'reasonable distances' with 'reasonable powers.' Wireless systems typically have bit error rates on the order of 10^-2 (1 in 100 bits bad), which will pretty much destroy the ability of protocols designed for 'wired' systems (TCP/IP, X/Y/ZModem, etc.) to function over any reasonable distance. Implementing sophisticated encoding with error correction would be a good follow-up project for the OP.

That is a whole study area in itself, and it gets quite complicated.
It is quite dependent upon the channel characteristics too.
The hot code now is a class called Turbo codes, invented by some frenchies.
Good luck with your project

Actually, TCP/IP probably isn't a good example, as what is on the lower layers can be entirely different and encoded and error corrected however you like, as long as the other end brings it back to the same data. Ok, that's probably a bit picky, but it is true. ;^)

Are you high?

Well, these folks are. Sorta. From 2003:
http://www.arrl-al.org/balloon_chase2.htm

We had another successful launch last week. The balloon reached 94,000ft. It transmitted aprs, id, position, altitude, and other data on 2 meters. It transmitted video at 434.000MHz from a downward-facing mini-camera. We chased it from Huntsalulu to the AL-GA border north of Mentone, monitoring *direct* APRS signals at 144.39 and 144.34. Also used an ad hoc rolling network of chase cars at 146.52 and other simplex frequencies. In short, this activity used just about every vhf trick in the bag 'cept weak signal techniques.

It was a blast. Even the farmer who was bushhogging when it came down on his pasture was ultra cool. He gave us a ride to the recovery site and acted like things fall on his farm from near space every day. Ho hum.

Oh, and the only internet activity was back at the launch site, where we were tracked on a map on a internet-connected laptop.

Charles, that may be to case in the US, but here in England, it was
the RSGB that killed off packet radio.

The Radio Society of GB had this odd idea that reducing the channel
spacing was needed because the commercial radio used closer channel
spacing than ham radio.

So now instead of 77 (of 80) channels mostly unused we have 158 (of
160) channels mostly unused.

Because a narrow channel requires less deviation, we all had to reduce our deviation. This reduced the range of signals, such that the one to one live activity that we enjoyed stopped within a very short time as our signals could not be heard.

At least APRS has increased activity on VHF here. However I agree that internet connections would appear to be more important for some folk.

I don't see why one person's dislike for a particular use of a couple frequencies should be grounds for such an attack. Hams do lots of different things, which is one of the attractions of the hobby. I have no real interest in APRS, but if others find it amusing to hook three or more different kinds of technology together to do something, why not? It is no more pointless than DX or moonbounce or QRP or dozens of other ham activities. If some people are having fun and learning a few things, more power to them, except the QRP crowd, of of course. N5PVL needs to get himself a hobby.

Our ARRL did nothing to damage the Packet hobby - and nothing to help it either. It was a secondary organization, TAPR, which was the main problem on this side of the pond. The irony here is that TAPR was allegedly supposed to support packet radio and it did - until a clique of internet junkies took the organization over in the late 1980's. The non-ham types have since discredited TAPR and had the organization to the point where last year, they hired a fellow to examine the organization in order to determine what it might be good for. - The report was inconclusive.

I could have saved them a little money on that one... I could have told them that TAPR was of dubious value for free.

> The Radio Society of GB had this odd idea that reducing the channel
> spacing was needed because the commercial radio used closer channel
> spacing than ham radio.

Yes, it's amazing how amateurs are supposed to innovate, and do new things - but there is a large group of halfwits who judge the hobby's worth and state of the art by how closely it resembles commercial stuff that has nothing to do with amateur radio. The TAPR halfwits disparage any aspect of amateur radio which does not resemble the familiar internet.

Judging by your experience with RSGB and our experience with TAPR, it should be plain (except to halfwits of course) that instead of trying to emulate existing systems, amateurs should be experimenting with new and different ideas that the commercial outfits may someday emulate.

The commercial outfits supposed to be following our lead as they have many times in the past - and not the other way around. The RSGB and TAPR folks being discussed are the worst kind of Luddites, in this respect. Because of their destructive ignorance, these people have no place in the hobby. We would be much better off without them.

I looked back at my post, and did not see any reference to "a particular use
of a couple frequencies ", or any attack of any kind.

Do you have any response to what I actually said?  - Or will you just put
words in other people's mouths and then answer them, effectively debating
with yourself?

>Hams do lots of different

I don't know... Since you have brought up the question of somehow "not allowing APRS", perhaps you can answer yourself. - Again.

>It is no
> more pointless than DX or moonbounce or QRP or dozens of other ham
> activities. If some people are having fun and learning a few things, more

That's your opinion, and you are welcome to it. My opinion is that ARPS is pointless, but that "DX or moonbounce or QRP or dozens of other ham activities" are not. The "ham activities" you mention are legitimate applications of amateur radio.

>N5PVL needs to get himself a hobby.

I have a hobby.. It's called Amateur Radio, not Amateur Telephone. We amateur radio operators are funny, in that we try to see what can be done with radio.

Try it out sometime.

Charles, N5PVL

Hi Charles:

I don't believe that is true. If you'll check early issues of Gateway (I think around 1993) you'll see APRS was initially developed to track sailboats out of the U.S. Naval academy in Annapolis, MD. So if you want to go pointing fingers, point it at the U.S. Navy.

Now, if your claiming TAPR shameless tried to ride the coattails of APRS, then I will agree with you. Their only real contribution to APRS was to form the APRS working group, which they quickly cut and run from leaving a adminstrative FUBAR'ed mess behind.

> The idea is to kill any interest in packet by eliminating its most
> interesting and useful features, substituting a pointless internet-dependent
> activity sure to put just about anyone to sleep.

Have you even run APRS? Up until about 1998 it didn't even use the internet, and the way it uses the internet is as a giant data collector. APRS is firmly in the RF domain, even if some people use it to track their homes ;-(

> APRS fits TAPR's ideal of a "killer application" perfectly - It kills off
> all interest in the hobby.

TAPR bashing aside, APRS has generated quite a bit of interest in the hobby, and a strong case could be made it has prolonged interest in RF based packet radio.

> The more TNC's they can talk hams into tying up

> so they can report thier house's position on the internet, the less will be

> interesting or useful.

Ahh.... now that is the rub, isn't it? "anything interesting or useful"

What do you suggest? The only other popular packet application on the horizon I see is WinLink. You may not like that, but those are the facts. And oh, did I mention, WinLink has a form of APRS position reporting in it as well.

Charles, you interest in some of streaming protocols is well placed. This could be a killer application if further developed and refined. If your that concerned, I suggest putting efforts into that.

Hello,

I just wanted to know if UI-View32 can run with Flex32, as UI-View16 does not and AGWPE sucks?

Hi Olivier

UI-View32 does work with FlexNet.

Hello,

I confirm that I asked for Flex32, which is the 32 bit version of
PC/Flexnet, as my computer runs with Win XP with hopelessly (or hopefully?)
no real DOS support as for Win 95/98.

Hi Olivier

If that's different to FlexNet (bearing in mind UI-View32 is a 32bit app)
then I'm afraid it does not support what you are looking for.

BTW: Personally I have not had any issues with AGW.

Hello,

Thank's for the info Andy.
I used to run UI-View 16bit either with AGWPE (soundcard) ro directlly with
my TNC2-Multi (TF2.7) and for APRS AGWPE is quite sufficient.
But I tested AGWPE for packet data transfer and compared it to Flex32 and
saw the superiority of Flex after only a few Bytes data transfer, only by
looking at the frames generated by AGWPE and that the generated traffic was
up to 6 to 8 time the normal volume we can observe when using PC/Flexnet or
Flex32, and so with lower effective file transfer rates.

So I forgot AGWPE and uninstalled it, only using now Flex32 (soundcard and
TNC2 in 6Pack mode).
The yet only APRS program with Flex32 compatibility I found, is WPP, which
is a packet terminal program too, with multi-BBS system support.

The only "problem" is that WPP has not yet all the functions we can find in
UI-View, but WPP must be considered as a backyard packet terminal project in
constant evolution.

73 de F8BOE Olivier ...-.-

```

Hi Folks!
     I'm hearing something centered on 430.9625 that sounds like RTTY.
 It's about 850 hz deviation, and at 150 baud RTTY, it decodes to alot
of:
 CC CC CV etc
Then sometimes it's:
IB
IB
IB
etc. Using MixW, it looks like only 2 tone, or I'd say it was FSK441
of some sort.   It goes on for minutes of key down, then off for a few
seconds, sometimes a minute, then it starts again.   It's not very
strong here in Jersey, but I have no super antenna either.

Anyone hear this? Know what it is?
Thanks!
Harry

Stupid question. I'm also a new ham.

What is the purpose of that software? I visited that website and it
had lots of technical details. But nowhere did I see a one paragraph
explanation of what problem it's reason for existence.

Tony

It's not a problem, it's another facet of amateur radio. It's an APRS program, APRS stands for Automatic Position Reporting System. Using a GPS and a TNC (or TNC-substitute) connected to a 2m radio on 144.390 MHz, amateurs can beacon their position to other users. Originally developed as a real-time, tactical system (think of a weather service forecast office being able to look at a computer display and see the real-time location of a spotter reporting a tornado), it has evolved into a multi-faceted system in it's own right. Here is a link to Bob Bruninga's website which explains all about APRS: http://web.usna.navy.mil/~bruninga/aprs.html Bob - WB4APR, is the developer/inventor of APRS. It's lots of fun, I personally have relayed my location signal through the International Space Station and PCSAT, which is an APRS relay satellite constructed by the midshipmen at the U.S. Naval Academy and launched into orbit several years ago, a double bounce! Talk about DX, 5 watts to orbit, through two stations, then back to Earth!

Ui-View is one of the most popular of the Windows-based APRS programs available, there are other programs that work with any operating system. Some allow you to bypass the TNC (Terminal Node Controller - a radio "modem") and use your computer's sound card to control the radio.

Read up on APRS at the link, and follow some of the links Bob gives for other fun and interesting aspects of APRS.

Hi Tony

In summery UI-View's objective is to display and generate APRS data.

Packet radio which is the basis of the protocol was developed some years ago (circa 1980) and allows amateur radio operators to connect there computers together using wireless technology (not what we call wireless technology today).

APRS is a protocol built on top of packet radio which allows you to communicate data such as GPS positions, weather reports, simple messages etc...

UI-View is a software application which understands the APRS protocol. This allows you to see and transmit the information which is communicated using the APRS protocol. For example you can see what road a car fitted with the appropriate equipment (GPS, radio and TNC) is travelling down.

Hope that helps.

In a few weeks I'm going to drive from San Diego to Brazil along the
pacific coasts of Mexico, Central and South America then around
Santiago Chile driving across Argentina to Uruguay and up through the
south of Brazil. I was wondering if a APRS system reporting to nets or
a sattlites would be viable along this route? Are there maps or
internet sites where I could verify that? I never used packet or APRS
before.Thanks!

Sorry, no help here about APRS south of the border (it works fine here
in Kansas, however).

This trip sounds like a blast. Sorry for all the questions, but this
is something I've always thought would be fun. It this personal
recreation or some type of adventure? Is it safe to drive all that
way? What type of clearances (passport, licenses, etc.) do you need?
What type of vehicle will you be driving?

It's a personal recreation adventure! I don't think it will be safe or easy but definitely fun. I'm not even sure exactly what I need yet, I'm sure we'll find out at the borders. I'll be going with 4 other people and we are taking a dually double cab pickup with a camper, diesel and 4x4.
Ideally I'd like to take a vhf "tracker" with built in APRS, and be able to have that data read and uploaded to websites along the way..I'm thinking that is probably easy to do in the states but I don't know about where we are going - there might not be too many hams around. That's why I was curious about satellites. The other option might be HF or cellular phone APRS but I'm concerned about cost and complexity - I don't know what equipment I need or how to do it. I have some old VHF radio shack HTs and a Garmin II+ GPS. I'm thinking about bringing a GSM cel phone like T-mobile (USA) or TIM (from Brazil) mainly for emergencies and SMS messaging.

Hi Dave

My first though (if your license covers it) would be to use HF to send a slow data rate stream back to your home QTH. Use PSK31 or Q15X25 maybe? 40M is probably good for 500 miles or so.

You may even get away with one of the meteor scatter modes on VHF (eg FSK441) depending on how much data you want to send.

There would be a few problems to solve of course!

My 2c worth

Cheers Bob VK2YQA

Version 2.1 of APRSPoint is available. It integrates Microsoft
MapPoint seamlessly to provide detailed street level support to track
other hams all over the world through either RF link or internet.
Visit http://www.aprspoint.com for latest info and the holiday
special. Thanks.

Thanks for showing everyone you lack a real understanding of APRS.
Ignorance is bliss.

Hallo anybody!

I am a journalist and I am writting an article about a new, interesting,
rapidly growing webservices. Now I am collecting the information about
```

InfoRelation.com .
I have found that InfoRelation was mentionned in this forum. So I would
like to ask you to send me your opinion about the InfoRelation.com
service
and its offer: the process of connecting demand and suply for knowledge,
skills etc.

I will be grateful for any opinion (also about the problems with
InfoRelation, InfoRelation's competitors etc.)!

Best regards,
Tim Kelly
PS. If there is anybody who earned any money on InfoRelation - please
describe me the field of interest in case of which the earning has been
arrived at

QTY	DESCRIPTION
1	60 FT ROHN 25g TOWER w/pointed top section
1	ROHN 25g BASE PLATE
1	ROHN 25g, HB25CS, HOUSE BRAKET
1	Icom 551 6m all mode transceiver (works)
1	Icom 211 2m all mode transceiver (works)
1	Heathkit SB200 Amplifier (220v)
1	Ham M Rotator (cked by Norm)
1	Tail-twister Rotator (cked by Norm)
1	Cushcraft R7000 Vertical (40-6)
1	Cushcraft 80m kit for R7000 (never assembled)
1	LJE GP1, RADIAL PLATE FOR 2" MAST, 24 RADIALS
1	Minkota, mdl: 765 MX, 12v remote trolling Motor (needs new prop)
1	18" Golden Rule for tournament fishing
1pr	Replacement 8" Steel Wheels w/rubber tires each wheel will support up to 60lbs, good for hand truck, etc,
3ea	ADULT MDL: KA1, KAPOK BUOYANT VEST, (never in water), LIFE JACKETS.
1	Micronta FS/SWR Meter
1	B&W Dipole Connector [V shape]
1	Bag of various (approximately 10) Xtals, FT243 variety, HAM band frequencies.
1	3/8x24, Spring mount with 2 springs,
11ea	Aluminum panels of sorts, 6"x12"x1/8"
3ea	Packages of NICE-DUCT, brown color, 3/8"Hx5/8"Wx60"L, each package has 5 pc totaling 25 feet.
1	12v WHINCH

2ea	50FT ROLLS OF RG6, 75 OHM COAX WITH "F" CONNECTORS
1	25FT ROLL OF RG6, 75 OHM WITH CONNECTORS
1	CUSHCRAFT BASE RING FOR 10M RINGO
1	SHAKESPEAR FIBERGLASS, 144-174Mhz ANT (MOUNTS ON AUT0 OR TRK)
1	QUADSTAR 2M HALO
1	Motorola, MITREK, MDL: T81JJA4900BK, WITH CONTROL & POWER CABLE - NO CONTROL BOX, NO MIC OR BOOK (AS IS NOT TESTED)
1	Radio Shack, 8", Antenna Mast Wall Mounting BKT
1	Motorola, MICOR, mdl: 02033a, WITH BOTH CONTROL CABLE & CONTROL HEAD AND POWER CORD (NO MIC OR BOOK) (AS IS NOT TESTED)
1	AMPEX 8" REEL TO REEL TAPE RECORDER
1	INTERMATIC TIME CLOCK, 110v
1	SCHUMACHER 10/30/50, BATTERY CHARGER, 12v
1	CROUSE-HINDS 3 LAMP, (RED/YELLOW/GREEN), TRAFFIC SIGNAL - ANTIQUE - WORKS GREAT!
1	AIPHONE AH108, 10W, 8 OHM, HORN SPKR.
43ea	INNOVATIVE SIMPLICITY, MDL: CREST, 2-JACK WALL PLATES WITH THE JACKS FOR TELCO
2ea	SMALL PEDESTAL CAMERA MOUNTS
8ea	GARDEN HOSE WALL BRACKETS

I am in Montgomery County, Maryland, and would perfer not to have to ship, but if I do - please figure postage from 20895.

Hallo,

I have visited InfoRelation.com and I would like to thank you for drawing
my attention to this service ;-). The idea of connecting demand
and supply for info, knowledge etc is great! Thanks to this I was able
to find an expert in the field of my interest and hobby.
As regards your advertisement I think that perhaps you offer too much
money to the members of the projetc team ;-).

Best regards,
Donald Martin

Hi All,

I got a new Kenwood TM-D700A, and notice the 913 - 939 approx is blanked
out, mainly to protect the US cellphone bands from being received.
I am in New Zealand, and we have 921 - 929Mhz are a ham band.
I would like to know if it is possible to see this part?

Any help or advise would be grateful.

Regards

Kevin, ZL1KFM.

KG8PM,

Thanks for the link, yes I have been to this site, only information is TX
expand, nothing about opening a close portion.

Regards

Kevin, ZL1KFM

Just ordered a new Icom PROIII, need to sell the following.

I will be offering my Kenwood TS870, PS-52, and SP-31 Speaker, MC-90
Microphone as a package deal.

Have no idea what it is worth yet, but this radio is a "Cream Puff".
Not a scratch on it, and covered with a towel when not in use.

There are some pictures of the radio on my Website.
Anyone interested, please drop me an email, address is on QRZ.com as well as
URL.

Very good. An equipment listing on the antenna and digital sites and then
he tells us to take a look at QRZ without giving a callsign.

This guy must be from 11 meters.

And in some of the six groups where it was cross-posted, it appeared
three or more times.

I think I should turn the cancel-bot back on.

Dave

I see you failed to fix any of the glaring errors that were pointed out over on Eham.

Guys, there's this thing you may have heard of called 'democracy'. It's a flawed system of government which assumes the majority is right.

This is the government you run under. This is the government that elected George Bush. This is the government that elected Kennedy, this is the government that elected Nixon, Clinton, and Roosevelt. Like it or not, there is nothing you can do about it. The system works. You have the President that most of you wanted.

This is why websites like 'sorryeverbody' really piss me off, what are they apologising for? Are they apologising that the system works? That the President who had the majority of the vote was elected?

The election is over. If you want your view to be heard, quit your whining, quit your apologising, quit your tiny blogs that few read. Write a letter, go on a march, and in four years time, vote.

gets off his soapbox

Very interesting. I read the thread over on eHam and some of the comments raised some important points. If those folks are correct, then that will be discovered as the software is developed and the system debugged.

Personally, I would like to be able to assemble a medium speed LAN capable of 128k to 384k speeds running in the 900 MHz band. I was piqued by the ZigBee announcement yesterday on Slashdot where it was mentioned that one of the bands to be used is 902 to 928 MHz @ 250 kbps. Adapting such a technology to ham radio would be cool. Out here in the sticks we would gladly trade down the bandwidth for the extra range we could achieve on 900 MHz over 2.4 GHz.

I agree that too many hams have bought into the notion that an amateur radio digital network must necessarily be a replacement for the Internet. If that were so then HF phone would have died long ago since it wasn't a replacement for AT&T. I say use the Internet but develop fun stuff on ham radio. After all, part of our charter is experimentation even if it results in some re-invented wheels. :)

73, de Nate >>

Keep your eyes peeled for AT&T/NCR WaveLAN 915 hardware. They made ISA cards and PC-Cards, and these were basically an Intel Ethernet controller glued to a 2Mbps 915MHz DSSS radio, running around +24dBm (250mw).

The ISA Card used an external antenna, while the PC-Card had an "antenna module" which was actually the radio.

Though it's now quite difficult to find motherboards with ISA slots, the ISA card is pretty interesting from an experimentation point of view - you have access to the barebones hardware and can tinker with the protocol. The Ethernet controller on the ISA card was an 82586, the controller in the PC-Card was a much simpler Intel controller, the part number escapes me. In 1995, I developed drivers for Solaris x86 for both of those cards and was quite happy with the performance.

I recall that BSD and Linux had drivers for these cards,
so you could probably get started without much in the way
of documentation.

I never did any long-range outdoor linking with WaveLAN 915,
but I did read reports of 5-10 mile point-to-point links
done with directional antennas. I've done 12 miles with
802.11b on 2.4GHz (under Part 15 rules), so 10 miles with
this WaveLAN gear sounds reasonable.

Cheers -
Dana K6JQ

For real world applications, you also need to consider the multipath
problem and avoidance using e.g. by frequency diversity (e.g.
frequency hopping) or space diversity (multiple antennas or movement).

With a fixed narrow band channel in the UHF and a stationary system,
you will sooner or later be in a spot, with a 20-40 dB signal level
drop, while the signal would be perfectly acceptable with the antenna
at a location 20-40 cm away or at a frequency 100 kHz away.

Paul

Actually X and Y modem are likely to be very hard to get up on such
a system.  Timing is quite critical, and turning around to listen
for an ack/nack is critical.  This is one of the reasons Zmodem was
born.

It is simple.

Write down what is required; how you expect each side to behave in response to each part of your protocol, and the program design is then obvious.

For example, you mention packetisation. How do you propose to encode your information such that the real data that you send is never confuse with the start and stop of packets?

Hi Usenet,

This is a popular search. Lots of people buy tiny RF modules and then go looking for a protocol, myself included.

I looked at a lot of stuff and concluded that I was better off, and certainly from an educational standpoint, writing my own.

I have 3/4 baked 8051 pseudocode for a HDLC with digital PLL, that various protocols can be layered over. Contact me privately if your interested in it 'as is', or if you think you might like to do some work on it with me.

Regards,
Murray R. Van Luyn.

> However, for 'real world' applications, you need to encapsulate the data in a much more robust encoding scheme -- at least if you need to go 'reasonable distances' with 'reasonable powers.' Wireless systems typically have bit error rates on the order of 10^-2 (1 in 100 bits bad), which will pretty much destroy the ability of protocols designed for 'wired' systems (TCP/IP, X/Y/ZModem, etc.) to function over any reasonable distance. Implementing sophisticated encoding with error correction would be a good follow-up project for the OP.
>
> ---Joel Kolstad

Hi all,

Thanks again for all of your assistance. Can I characterize my connection as a "virtual RS-232 connection"? I do have a pair or transceivers with serial data in/data out. I haven't gotten too much information from the vendor that sold them to me, but from what he has said, I will need to produce a transmitted waveform with apx. 50% duty cycle, for which he recommends I use Manchester Encoding. He also has explained that I need to transmit a preamble (he said a square wave for about 5 ms would do) in order to allow the receiver time to stabilize before receiving data. Without the preamble, he says I'll lose the first several characters that I transmit. He also said that I'd have to choose a pattern that I won't find in my data stream to use as my start code.

I also agree with Joel (above) that I "should" have to worry about errors as a result of this being a wireless communication. (Whether I will actually experience a reasonable amount of errors if I put the transceivers right next to each other remains to be seen, but I'd like to include error detection and possibly correction as a part of my project nonetheless.)

So, given all of this, I'm thinking that any protocol I use as a reference needs to be designed for wireless communications so as to show me how all of these needs are addressed. Perhaps I might be able to use protocols like XMODEM to observe how some common things are done (i.e. packetization).

BTW, does anyone know how to figure out how large to make your packets when designing a protocol? I imagine that if you make a packet too large, you defeat the purpose of breaking up your data and increase the chance that your packet will contain a corrupted piece. On the other hand, if you make your packet too short, you lose efficiency because your packet header overhead will dominate the size of your actual data payload. Given that, how do you pick a size in between? One way to do it would be experimental--just try some sizes and see what works. Any other ideas?

Thanks.

The zmodem protocol used back in the latter days of phone bbs's used a variable packet size. If you were getting lots of errors, it would drop packet size down till some packets got thru without an error, if later it detected that all packets were getting thru without errors, it would up the packet size to increase thruput. If it got down to minimum packet size and still had at least one error per packet it would abort the transfer. If you include some form of error correction along with the packets then you lose another 30% or so of thruput, but you can survive simple bit errors, and it takes a multiple bit error to be unrecoverable. And when I speak of errors I refer to unrecoverable errors, that the error correction couldn't fix.

Error detection is mandatory for any sort of packetized communication.

You might also check out the code used by modems around the time of v22.bis (2400 cps modems) and later. Most of them offered error detection/correction and data compression which meant the data was packetized.

A friend just gave me a PK232 controller. I'm really interested in picking up the upgrades, but not willing to pay list prices for them, which seem a bit high to me, since you can get a basic tnc for less, or make your own sound card interface tnc.

Anyhow, if anyone has any upgrades, please reply to the group or my email address. Just remove nospam from the address.

Thanks,

Brian

==============================

Your sentiments are world wide. But to be correct, only 51 percent of the
population voted for him. So there's still hope.

Nevertheless, the USA, with the aggressive populace armed to the teeth and with 15,000 gun-deaths in the homes and streets of US towns and cities every year, has taken yet another step towards the next civil war.

Who needs suicidal terrorists?

It is rather sad that 49% of voters are so stupid.

> Nevertheless, the USA, with the aggressive populace armed to the teeth

And you would know this how? From living here?

> with 15,000 gun-deaths

Our guns are dying? First I've heard of it. I always thought they were
inanimate objects. You''re telling me they are alive?

Actually, only roughly 30% voted for him. If all the potential
voters who didn't bother to vote had voted for me, I would
have gotten more votes than Bush or Kerry. Scarey, huh?

>He's a complete moron and so are most of you!

"Moron" vs. "Insane suicidal murderers" - not a good situation, I agree. However, our only other option was a wimp.

>Don't you care what the rest of the world thinks of you?

Certainly I do. I want to be known as the country who helped to wipe out the insane suicidal murderers.

>Don't you care what impact
>American foreign policy has on the rest of the planet?

Well... yes I do. If we could meet with more cooperation, there would be much less destruction. This planet is running out of room for dictators. The destruction in Iraq is being caused by power hungry idiots who think they can become the next dictator - not by the US. We are attempting to stabilize the country. We have attempted to help rebuild the country and the insurgents have murdered the civilian contractors that were there to aid the Iraqi people.

>Does Iraq look like a success
>to anyone?

Iraq never looked like a success - even when Saddam was in full power. Iraq could have been a success - but it had a nutcase for a leader. Here you are in the middle of the "black gold" center of the world and most everyone still rides camels. That is why this crap happened to it. I have a lot of hope for the Middle East. I suspect it will eventually rule the planet - but certainly not with its present attitude - and certainly not without being united by a common vote of the people.

>Doesn't it bother you that he's alienated every friend you have?

Bush is my buddy. We have the right friends. It was your choice to avoid friendship.

>Prior to this, it was American policy and the American government that was so universally

>hated around the world. Now it's going to be 'Americans' we hate.

Hate breeds war and more destruction. When will the folks of your persuasion realize that you need to stop hating? If you are an Iraqi - you should help us help you instead of fighting to support your hate. Look at Japan. A relatively small country that is a HUGE success. They smacked us. We had to smack them back. But we didn't leave them behind - and we won't leave Iraq behind. We all sincerely wish the fighting would stop, but it is clear that Iraq would remain unstable as ever if we just left. There are still way too many "would-be" dictators and nutcases.

>More sympathy
>for Bin Laden... More attacks on American institutions... More isolation.
How blind
>can you dumb rednecks in middle-America be, not to see this?

More sympathy for an insane murderer who stirred up a massive wasp nest that stung everyone on the planet - including you? And you call *us* stupid? Bin Laden is the one who caused all of this! Bush HAD to make policies to stop this type of stuff. Your enemy *IS* Bin Laden and people like him - not the US. You can't see this?

>If you get hit again, or your economy goes into a deep depression, the
American
>people will be getting exactly what they deserve!

You don't want that to happen. Believe me. You think it's bad now? Do what you can, on your side, to stop breeding hate - and the pyrotechnics will stop.

Personally, I don't give a rats ass if you like the US or not. Funny, all
you fags hate us, but yet you come to US for financial aid at some point -
EVEN if you have money from oil. If ya don't like US, then quit trying to

get on our welfare roles. I'm sick and tired of all our tax dollars going to you scum bags while our elderly and others go untouched with aid. You're all a bunch of wimps. Our soldiers will do hand to hand combat with you any day of the week. Your people couldn't fart without holding a knife or gun. YOUR people couldn't hold anything over our guys in hand to hand combat. Hell - our female soldiers have more balls than you scum bags. US FOREVER - ALL ELSE (WHO HATES US) - DIE.

TBA (TRUE BLOODED AMERICAN)

HeH. America in deep depression. And all those "rednecks" with a garage full of nukes   ---- 2nd Amendment approved and sanctioned nukes no less   ---- and pocket rockets. Not to mention plain old ordinary "assault weapons". Pissed off and armed to the teeth. And this limpdick, lowlife, pissant, trolling Usenet with his message of hate? I wager he is the first one into the hole. Trying to pull it in behind his sorry ass. Didn't he watch O'sammy-ben-laden on Teee Veee the other day? Whimpering his message to GW of "Please don't hurt me, I didn't -really- mean to knock the towers down. I just wanted to fuck them up a little bit. I didn't know the USA still had real teeth 'cause I was payin' attention to the limpdick left-liberal peace freaks America's freedom of speech tolerates. Hell I thought America was just like Saudi Arabia, the Sudan, and Afghanistan where subversive speech gets your fucking head chopped off. I didn't realize that in America even stupid people who have never had an original thought in their life are allowed to speak as if they were the goddamn King of the World." Eh?

Um, Don... I didn't see that Teee Veee thing. Got a link to something on
this?

Sorry to the groups. But this kind of gets me - and every once in a while
it is nice to talk about something other than charcoal :-)

>inanimate objects. You''re telling me they are alive?

Yah, but with something like 43,000 automobile deaths (cars die too,
mine did right in the driveway this morning) and no one gets excited,
why get concerned about 15,000. We need to outlaw cars first.

Actually accidental deaths by guns is its lowest since 1907 and
violent crime is at its lowest in 20 years even with the economy
suffering a tad.

While the rest of the world is seeing strong increases we are seeing
decreases in violent crime. In addition, every state that has passed
"right to carry" laws, firearms crimes have gone down.

Contrary to popular belief outside the US we are just normal people
and it's not at all like the old "Wild West". OTOH a high percentage
of the population does own firearms.

Now, I gotta go clean my AK-47. Deer season is opening soon.

Roger

Strange.... the second part actually seems to make more sense!

<Victim_of_American_Stupidity@gafbi.ut.us> wrote in message
news:sqelcyzodllzlnv0xyctlrvh1enzjpk@4ax.com...
You blithering idiots! You re-elected that imbecile George Bush as your
President.
He's a complete moron and so are most of you!
-
Don't you care what the rest of the world thinks of you? Don't you care what
impact
American foreign policy has on the rest of the planet? Does Iraq look like a
success
to anyone? Doesn't it bother you that he's alienated every friend you have?
What were you thinking???
-
Prior to this, it was American policy and the American government that was so
universally
hated around the world. Now it's going to be 'Americans' we hate. More
sympathy
for Bin Laden... More attacks on American institutions... More isolation.
How blind
can you dumb rednecks in middle-America be, not to see this?
-
If you get hit again, or your economy goes into a deep depression, the
American
people will be getting exactly what they deserve!
-
<back turned>
-
-
-

Hey, at the rate the fundamentalists are taking over the Republican
party they will not only be a majority in Congress, but in another 10
years you may have to become a born again Christian "and Republican"
just to hold office.

I'll send my contribution to the NRA.  <:-))

Hallo,

I have advertised on InfoRelation.com some project connetcted with the
subject of our discussion list (you will find that project by choosing
appropriate category and subcategory).
Please let me know about your opinion relating to my project. As I have
already written in my advertisement on InfoRelation - it will be possible
to earn some money on this project.

Thanks for all,
Sandra Smith

Now that is certainly a valid point.
There have been some good columns in the Orlando Sentinel this past
week on that subject.

It gets into more of the low level detail than you might, perhaps, be interested in for this project, but I'd recommend Bernard Sklar's book, _Digital Communications: Fundamentals and Applications_ for a very good book on the basics of that topic. Second, if you do elect to design your own protocol, I'd recommend modelling it before you deploy it. You can find errors quickly and easily in a model that you might only rarely encounter in real operation. To find out more about that, I'd recommend Spin, which you can read about at http://spinroot.com/spin/whatispin.html

Good luck!

Ed

Morons like you, and diatribes like this, simply reinforce my commitment to our way of life.

Every now and then it becomes necessary for someone to stand up and make other accountable for their actions, or, lack thereof. We do that while most of the world sits back and watches. There are Alfa Countries and Beta Countries and I think we Americans can get along fine without the Beta Countries. They're weak, they have no resolve and they are not willing to step up. Have we and will be make mistakes? Sure, but, that happens because we are human and as such we are prone to making mistakes. However, is the world better off in the long run because we step up? Damn right they are. Start counting the interventions and therein lies your answer. And, to you, Mr. Coward who won't ID yourself, let me tell you one thing; you are likely safe and secure because of us. Is that arrogance on our part? No, that's being accountable, something you're not, and something most of the rest of the countries of the world aren't either. Go ahead and balk at the Saddam's of this world and see where it gets you.

Hallo,

I think that everybody will agree that InfoRelation is a very useful proposal. Thanks to this service I was able to finish my academic project in field of biology. Also I can recommend InfoRelation for those who would like to earn some extra money (I have checked it and it works

;-))!

Hello,

Does anyone know if there are any advantages/disadvantages to sending
data in MIC-E format over plain APRS text?

Also, my tinytrak 3 data burst "sound" is quite a bit different
sounding than other people transmitting on 144.39.. is this normal or
do I need to calibrate?

Thanks,
Dan

rec.radio.amateur.homebrew:4643 rec.radio.info:61

The Amateur Radio Elmers Resource Directory, a list of experts, mentors, and gurus for amateur radio on the Internet, went on indefinite hiatus on June 1, 2000 after just over 9 years of service. This decision was not forced upon me by anyone for any particular legal or technical reason. Rather, I decided to retire from maintenance to focus on other personal and professional interests and obligations.

I also felt that I had taken this project to the limit of my expertise and spare time in terms of format, visibility, automation of maintenance, effective recruiting, and even good Web design. It's clear that the Internet had changed greatly over the 9 years that the Directory had been in existence. The Directory had evolved from a flat text file edited on a VAX running VMS to a well-featured Web site. However, in that time, much better amateur radio-related web sites had emerged (including QRZ, Ham Radio Online, and ARRL) that make my site rather simplistic by comparison. Also, it's clear that many more enhancements would be required to make the Directory more maintainable and secure. One requirement that the Directory did not address is reasonably shielding the Elmers from having their E-mail addresses harvested for junk-mail distribution lists.

I want to emphasize that I do believe that using the Internet, the Usenet Newsgroups, and the World-Wide Web to bring Elmers and amateurs requiring assistance together continues to be worthwhile. Because of this, I would consider a highly-qualified and motivated volunteer to take it over immediately. The Directory consisted of a moderate number of large text files, scripts, and other configuration files. It's neatly arranged, and can probably be easily transplanted to another Unix/Linux environment. I would also be willing to assist with importing the data into a database such as mySQL. To help transition this project to another maintainer, I had prepared a maintainer's guide, available on request. The ideal candidate will be a motivated self-starter and self-teacher possessing several years of experience in:

- Unix/Linux
- C or Java
- HTML
- Perl or Python
- Procmail
- Version control systems such as SCCS, RCS, CVS, etc.

(this also implies that you have the above tools installed in your environment)

preferably on or more of the following:

- SQL
- PHP
- CSS

and have approximately 4-6 hours of spare time per month for maintenance. A track history of successfully completing projects would be a firm requirement. Please note that hosting sites are already available. Offers to host the project, but not maintain it, are not being sought at this time.

Familiarity with news.answers formatting conventions and the auto-faq FAQ Management and Posting Package would be a plus. Concrete proposals for enhancing the Directory to be a top-10 amateur-radio-related Web site would also be desirable. I would also consider the Directory being incorporated into an existing commercial amateur-radio-related Web site as long as the essential non-commercial character of the Directory was maintained.

If you feel that you possess the interest, motivation, and immediate, hit-the-ground-running, skill set to do this, please send your statement of interest and any proposals you wish to make regarding your plans for future enhancements to elmers-request@novia.net.

I would like to thank all of the volunteer Elmers, as well as courteous users of the Directory, for making this service a success, as well as an enjoyable experience for me over 9 years.

I'm not sure about MIC-E. I think it's abreviated but would work just fine. As for the tone sounding off.. Yup, absolutly. For some reason mine was WAY off. It turned out I needed to load with the 1.1 version of the software and then change the offset to 127. I hooked a counter up to the audio out and adjusted the tone and got it close. But original the 2200 time was about 1800, with the 1.0 version of software. I can't beleive it was bad software, Probably a bad download. I have a TT3 in both the mobile and in the pocket tracker. Both needed to be 127 on the offset and that out then within a few cycles.

```

APRS was developed as a packet radio "killer application" by folks associated with TAPR in the US.

The idea is to kill any interest in packet by eliminating its most interesting and useful features, substituting a pointless internet-dependent activity sure to put just about anyone to sleep.

APRS fits TAPR's ideal of a "killer application" perfectly - It kills off all interest in the hobby. The more TNC's they can talk hams into tying up so they can report thier house's position on the internet, the less will be used for communicating as hams or doing anything else that may be interesting or useful.

In the US, tying up equipment to do APRS has taken the place of astrology, numerology, or socialism a quick (lack of) intelligence test.

Charles, N5PVL

<snippety>

Thank you for sharing your opinion.

I'm sorry you feel as you do.

I disagree most strongly.

There, now, wasn't that simple?

Oh, one more thing... *PLONK!*

I have to agree some what.. It's funny around here 90% of the APRS activity is saying the house hasn't moved in the last few minuets. While APRS has some interesting applications, I think it's suppose to be for tracking moving objects. So unless you think you live near the yellow brick road, why keep telling everyone where you live?

Just me, I'm sure..

Joe AG4QC

A great loss, gave so much back to the hobby.

Heartfelt condolences to those he leaves behind.

 - Steve

Jumpin' Jesus Charles; ax.25 is appropriate for short-haul communications. It is horrible on HF. What part of that do you fail to understand?

Or are you not licensed for HF?

I don't see a callsign, so must assume that this moron is another non-ham
troll.

One problem with usenet is all of the trash that goes along with it... The
porno ads, the idiotic trolls, and so on. Still, its fun and sometimes very
informative, once you filter out the worst of the trash.

-----OOOOO-----

That reminds me of "Scott", a really smart-aleck type of spammer who just had a good old time here with his "anonymous" E-mail address, pestering people in a minor, annoying way much as "Airy" here tends to do.

Scott had a good old time until I sent him a personal E-mail with all of his personal data included: Name, Address, Social Security number, Drivers liscense number, his place of employment, it's address, plus the make and color of his car.

We never heard from Scott again after that... (Scott from Austin, Texas... Howdy, Scott!)

It's really not worth the minor inconvenience that is involved, but if I decide to send "Airy" the same kind of information, I won't bother with a personal message... I'll just post it right here on usenet, on every newsgroup "Airy" has ever posted in.

Charles Brabham, N5PVL

-----OOOOO-----

Party Pooper!

There I was, considering chipping in a few buck to embarrass someone who has no pride in themselves, to begin with. Silly of me!

Charles, N5PVL

-----OOOOO-----

What do they want French lice for, anyway - and why are they having so much trouble getting any? From what I understand, it's no longer even necessary to go over the channel. Things are much simpler now days. You no longer have to go far out of your way to pick up a truly amazing (international) collection of vermin, almost anywhere.

Charles, N5PVL

-----OOOOO-----

Sir, you appear to be confused on this issue.

I have heard amazing stories about the extreme lengths that cowards will go through in order to avoid military service. I consider some of these efforts to be both heroic and most definately in the service of their country. If you think this matter through, keeping in mind the fact that you would not want one of the cowardly bastards at your back in the first place, then I am sure that you will begin to see some of these extreme, even heroic efforts in a new light.

So do not discourage these cowards, sir, or disparage the fruit of their labor... - Root them on, as I do!

Charles, N5PVL

-----OOOOO-----

Yes, exactly! Our President Clinton was in Oxford England, busy smoking pot without inhaling during the Vietnam draft and was terribly disappointed I'm sure to discover that the draft board could not get their hands on him while his experiments in pot-puffing continued at the fine old university.

Many have castigated "Bubba" Clinton for this sleazy cowardice, but if you think about the best interests of the poor men this prominent coward might have ended up serving with, it is plain that the pot-puffing he plainly detested was done in the best interest of his country. We should all take a moment to appreciate this heroism, enacted on upon the shores of a foriegn land.

Charles, N5PVL

-----OOOOO-----

Yes, I have a buddy in Iraq, and he told me about the arrival in Quwait, where they gave the troops injections in the big cargo plane, so that they would not pass out from the heat when they stepped out onto the runway. Caravanning into Iraq, the young man ended up in action within a couple of hours of crossing the border from Quwait. - That was early days, when it was carloads of screaming morons with AK's instead of roadside bombs.

The way the terrorist's tactics over there have (slightly) improved once the early carloads of screaming morons had eliminated themselves shows plainly that adversity has improved the breed, over there. I am confident that if we apply a good deal more adversity, the terrorist breed will improve enough so that those who are left will eventually approach recognized civilized standards of decent conduct. - But then again I am known as an optimist, always looking for the better side in my fellow man, even in the case of these scumbag terrorists.

Most of our cowards go to Canada, where its nice and cool... Where do yours go?

Charles, N5PVL

-----OOOOO-----

Yes, that is true - but you must admit that Bubba's cowardice would have made him a poor choice for that sort of work anyway. He would have been at least as dangerous to his companions as he could ever possibly be to the Vietnamese, if not more so. It would be very hard to make much headway on improving the socialist breed there in Vietnam, at that rate!

Once again, it is made clear that cowards should be honored for the great lengths they sometimes go to, in order to avoid the military service.

Charles, N5PVL

-----OOOOO-----

Another person who encourages cowards to do what they do best? (run)

Charles, N5PVL

-----OOOOO-----

I haven't heard of the enlargement of Europe before... What happened to those poor people?

Charles, N5PVL

-----OOOOO-----

New DX CLUSTER NODE - TELNET address N9MXT.TZO.COM at PORT 23

Come connect and enjoy the world of DXing!

Just wanted to inform you all its out here to service your DXing needs!

EchoLink Node #198432 an if your local email me and I will tell you the RF frequency input/output for the node.

Thanks and hope too see you guys connect to the node.

Jeffrey

Hi All

Roger Barker - G4IDE sadly passed away on the 9th Sep 2004. Roger is the
author of UI-View32 the worlds most popular windows APRS program.

The key features of UI-View32 are:

Displaying APRS data including area symbols
Full-featured internal intelligent digipeater.
Support for connecting to APRS servers on the internet.
Wide range of mapping options available.
Open-Architecture, allowing add-on programs to be written with ease
Sending messages, support for remote commands
Loggging of data and playback of previous log files
Displaying of pre-defined overlays
Tested and proven stable across multiple windows environments

For more information and download take a look at http://welcome.to/uiview

73 - Andy, M0CYP

Assuming you run windows (if you ran Linux you would already know the
```

answer), from a MS-DOS window, type: "telnet n9mxt.tzo.com" for his
cluster.

However, the telnet client in windows isn't the greatest. I recommend
that you install Putty (free, available on tucows.com).

It dosen't look like it. There is a certain amount I and others can do using
the ActiveX interface into UI-View32. But bar the source code being released
the core of the program will remain the same.

Is anyone familiar with the hardware details of the FSK process?
Specifically what components are involved in transforming a frequency
into a bit?

Thanks!
Dave

It depends on how it's done.

The earliest schemes were switching a capacitor in and out of the circuit of a VFO. I think they may have used relays originally, but once semiconductor diodes became common, they were used to do the switching. Apply a voltage, the diode conducts, and thus connects the capacitor into the circuit, lowering the frequency.

When SSB came along, a common means was to feed an audio oscillator into the mic input, and that audio oscillator was shifted between two frequencies in the same way as above. Since a single tone in an SSB transmitter is the same as a cw transmitter (the transmitter translates the tone to a radio frequency), then shifting the audio oscillator shifts the transmitter between two distinct frequencies. This method was handy since it required no modification of the transmitter, and you got the same shift across the band. The previous scheme could not give the same shift as the vfo shifted frequency, since it was a fixed capacitor in parallel with the variable capacitor, so the fixed capacitor would give more shift as the frequency went up (since it was a larger percentage of the capacitance of the variable capacitor). The downside is that if the SSB transmitter wasn't adjusted for good carrier supression and unwanted sideband supression, or the audio oscillator did not put out a pure enough sinewave, then one would get more than a single frequency out of the transmitter.

As an aside, on VHF AFSK (the shifting of an audio oscillator fed into the mic input of the transmitter) was pretty much the only scheme used for RTTY. Here, the result was not FSK, since you were using the regular modulation, AM or FM, of the transmitter. And the audio oscillator did not need to be as pure, since it didn't affect the spectrum of the transmitter.

I actually don't know what the common scheme for FSK is these days. If the transmitter is using DSP, the fsk can be done digitally. I assume that DDS-based VFOs in current rigs may actually be able to be reprogrammed at a fast enough rate that one just keeps loading the two frequencies into the synthesizer as the shifting is needed, but I've not kept track of recent rigs to know if that's what's being used.

This is pretty reasonable at low bit rates. But some more recent DDS chips, for example, TI's TRF4900, actually have a data pin, and the two frequencies are programmable, so the chip has the two divisors onboard making it a simple matter to switch between divisors.

I think you already have a couple of messages on how the frequency can be generated from a bit.

It appears to me you are asking for the opposite.

Basically, the modem runs the receive frequencies through narrow filters. If the frequency received matches the passband of the filter, the audio tone gets through the filter. The tone can then drive something as simple as a transistor amplifier or darlington pair from one state to another (e.g. from Vc=5v to Vc=0.5v). These outputs can then drive gates in the right combination to get your serial output.

What has changed over the past two decades is how the filters have been implemented and how the serial signal is generated.

What used to be narrow filters built with big inductors and critical capacitors became filters implemented using op amps which, in turn, became filters using dsp techniques.

Serial signal generation started out with straight off and on pulses to rtty ksrs, moved to simple uarts built with logic gates, which became uarts on ic's.

The basics are the same, however. Narrow filters for the tones and logic to generate the serial signal.

Ok, I have one more additional question. :-)

For a communications protocol such as RTTY, I know the mark and space
frequencies indicate 0 and 1 values of a (usually) 5-bit character.
But how does the receiving side synchronize with the transmitting
side?  How does the receiver continue to properly allocate the
incoming bits?  After, say, the 30th bit value, how does the receiver
know that it *IS* the 30th bit value?  Especially with three 1's or
three 0's consecutively and no frequency changes...?

Is the receiver just very accurately timed?  When it occurs, do the
transitions from 0's to 1's (and vice versa) serve to resynchronize
the receiver with the transmitter?

Sorry for the storm of questions, but thanks in advance!
Dave

OK, remember the whole start and stop bit thing?

The line sits at mark when idle. When a character comes, the line drops to space for one bit time. This is the start bit. Then the 5 or 8 bits are transmitted, then one, 1.5 or two stop bits, which are really nothing more than the minimum time between characters. So the receiver is guaranteed *at least* one bit time of mark followed by exactly one bit time of space between characters. The receiving side does need to be reasonably accurate, but only accurate enough to not garble a character. It never has to keep in sync for more than 10 bits worth (8 data bits plus a start and stop bit). If the protocol specifies more than one stop bit, from the receiver's perspective that is nothing more than additional time the transmitter has allotted to do end of character processing.

On your earlier question about receiving FSK, the various posters answered what you would do if you wanted to use an SSB or AM rig, or an audio FM rig to receive FSK. However, a purpose-built FSK receiver would probably use an FM discriminator, and simply recover data, rather than audio, from the discriminator. Remember that an FM discriminator has an output that is related to the frequency. If you fed the discriminator two frequencies, the output would be two voltages.

> Ok, I have one more additional question. :-)

Sorry, I skipped something on the previous response.

I answered for ASYNCHRONOUS serial such as RTTY or async ASCII.

Some protocols, such as packet, use SYNCHRONOUS serial. Synchronous serial is a lot harder to receive. There are no start and stop bits, so the protocol doesn't involve that part of the overhead that async uses.

There are several synchronous protocols, but they mostly involve two characteristics.... first, there is some mechanism for the receiver to recover the clock. Frequently, the clock is embedded in the data, although is could be sent over another channel. This allows the receiver to know the bit boundaries. Every so often (typically every data packet) a special pattern is sent that allows the receiver to identify the character boundaries. In the common protocols, such as X.25 (or AX.25), there is also

a prohibition against sending too many of the same bit in a row. Special
procedures are invoked if this happens in the data.

I don't view it as a storm of questions; I'd be surprised if anyone did, considering the floods asked by folks in some other newsgroups.

Synchronization can be A Right Bitch. Good, Cheap Timing is part of the answer, and I think that the receivers also do some timebase adjustments as needed to keep their bit-rate clocks in sync with the transmitters'.

When you add start and/or stop bit, things get a lot easier, and that is the case with most serial communications: you can reset the character and bit-time clocks per-character. When no sync bits are present, you have to derive the bit timing and character timing from the data-bit transitions in the data stream, and things can get a bit iffy. Telco circuits have hardware that requires K transitions per N bit times, and will stuff "1" or "0" bits into the stream on one end, and delete them on the other, before they get to the customer gear, so that the stream appears to be synchronous, even though it isn't really synchronous inside the telco circuit.

But TY gear is _asynchronous_: it has bits to signal the start and end of each character.

The general structure of a TTY character is

Start_Bit, Data_Bits, Stop_Bit.

The Start_Bit tells the machinery that there's a character coming down the pipe, and that it should get ready to move. When I was doing military communications, Way Back When, the start bit was a 1.5 bit time MARK, since there really were parts that had to get ready to move, clutches to engage, and so on, and the extra time ensured that things were ready when the first data bit came in. The stop bit was a 1.0 bit SPACE, IIRC, so that there was always a polarity change to signal a new character. But that's memories almost 40 years old, and I Could Be Wrong.

Try this for more info:

Another little piece of the story is that in start-stop operation the receiver samples the incoming signal at the place where it expects the center of the bit to be. Thus it is tolerant of signals that are too fast or too slow. Of course today it is easy to get the speed very precise; but in the early days it was a matter of motors with centrifugal speed governors.

With synchronous transmission the receiver knows where the bit boundaries are going to be, so it is possible to sample near the end of each bit time when all of the energy in the received signal has come in. Start-stop has to throw away roughly half of the energy in each bit because of the center sampling. Hence synchronous transmission has an advantage in signal-to-noise ratio.

In the days of mechanical teleprinters, synchronous operation had a much greater advantage. A mutilated STOP pulse would allow the receiving shaft to continue rotating, and then several characters would be received in error as a result of that single bit error. With electronic reception there is no rotating shaft, so it is possible to reset the receiver to the starting position instantly.

It is also possible with electronics to achieve a quasi-synchronous operation with start-stop signals. The idea is that instead of having the STOP pulse be arbitrarily long, it is of fixed length and an idle character is sent if there is nothing to send from the keyboard. This is usually called "diddle". With the incoming data stream being a steady stream of printable characters and nonprinting idle characters it is synchronous for the duration of the transmission. The detector can synchronize to this signal and take advantage of all of the energy in each signal pulse. The K6STI RITTY software (no longer marketed)

operates on this principle.

Yes, because I can't figure in which book they'd be talking about PLLs.
Osborne books tended to be about software, and when it was hardware

it was about CPUs. I do have one Osborne book about video controller
ICs. But I don't remember there being general electronic books from
the company.

Thanks for all the great information guys.. that helps a lot...

So, where can I get a good comm program that has RTTY capability
(ideally freeware, to get started with) for my computer?

Thanks!
Dave

You couls start with a google search for "rtty12g" which is a very
old program written in BASIC to run under DOS. That's a program I
have used to make a TTY machine play in a museum situation.

Or there's the modern free MMTTY program, which is intended for running
RTTY on the air, but it has an output to FSK key the transmitter and you
can use that to drive a TTY machine (through a suitable driver circuit
of course) What it doesn't do, and I wish it did, is while receiving
to output "cleaned up" TTY signals so they could go to a printer.

Go here for sound card programs. As mentioned mmtty is very good to start
with for rtty.

http://www.muenster.de/~welp/sb.htm#zvei

Here is another place to checkout. It mentions packet, but the interface is
for all sound card modes.

On Fri, 24 Sep 2004 18:44:20 -0500, "Dave VanHorn"
<dvanhorn@cedar.net> mused:

>Which sort of "packet" do you mean?

Almost as soon as I sent this, I realized that I had not been very clear...

I am mostly interested in the following aspects:

1) Keyboard-to-keyboard ops

2) BBS ops

3) APRS

4) And, perhaps the most important/interesting, new uses

But then again, anything would be interesting!

APRS is going just fine here, activity is about level with last year, a few
new stations.

APRSPoint 2.0 is available. It added support of track lines for
station tracking, automatic TNC reconnect and TNC auto config, plus
several fixes and enhancements. Visit http://www.aprspoint.com/ for
details. Thanks.

This group should work ok.

More than a few of us who hang out here have used
WiFi gear on the ham band under ham radio rules.

Hi,

My AEA PK-12 can't start because of misconfiguration (all the LED are on).
I have this situation few years ago and I can restart my TNC with the
floppy "PcPakratt for DOS" given with the TNC.
Unfortunable, my original floppy is broken.
Who have got this floppy and can send me a copy (via mail) ?
Is someone have another idea for restarting my TNC ?

73 de Phil, F5IYJ.

I have for Auction a Standard GX-3000 VHF APRS Radio [with DTMF] These Radios are Commercial Standard GX-3000 VHF Mobile Radios (136-150Mhz) 25-30 Watts O/P This radio will work very well as an APRS Mobile OR Base Radio Station. Units are much cheaper to use for dedicated APRS use rather than spending Large Dollars for a VHF Amateur XCVR and dedicate it to APRS use.... Programmed & Tested Operational on 144.390 Mhz. Am including a schematic of the Mic Connection.... You will have to make up the Interface Cable. These radios are capable of 64 Channels, Carrier Squelch Only and I can program them for other 2 Meter Frequencies for a charge. Please ask should you have any questions.
>> I have access to a LARGE Quantity of these if there is a requirement <<
73 & Tnx for looking....Norm VE3CZI

Anybody remember that Scientific American article from the early 1960's,
where the subject kept referring to the act as "Master Painting"?

See, not ALL the hot stuff was in National Geographic or CQ.

No, we just have to put up with a bunch of ass holes who have nothing better
to do with their time. Either juvenile delinquents or dick heads who don't
know how to carry on a "conversation" so they have to post this stupid shit.

They ought to take their computer and shove it up their ass.

Oh and the ass holes are really giving their "true" identity. Give me a
break! Maybe you prefer to read their stupid shit... I see you use a DESPAM
ADDRESS TOO! SO WHAT, if I don't use my name..... I could give ANY name,
proves nothing. I'm not the one sending the trash. Attack the ass holes, not
me. Sheeeesh.

If ya want a name, try this....

Joe Schmo

KISS MY ASS..... How do you get YOU are using a REAL address, with DESPAMMED .COM???????????? HUH?????
What an ass.............

Foul mouthed drivel? Maybe foul mouthed mixed in, but the truth. It was NOT intended TO you before, BUT NOW IT IS.

You are such a dick. You call me a yellow belly, you CSer. Good thing you live in BLOODY ENGLAND. ASS WIPE.

You need to laugh, if you were here, I would show you who is a yellow belly,
you ass..Maybe the G isn't for England as in Ham Call Sign, maybe it is for
your G STRING that you wear. Come here, I'll give you a bloody lip for
calling me a yellow belly.

In case you haven't noticed you idiot, MANY do NOT use their rightful name
or e-mail address. I'm not the only one. SO GET USED TO IT. You have no idea
how much I'd love to kick your ass right now for calling me a yellow belly
JUST because I chose not to list my address. GET A LIFE.

Don't bother replying ass wipe, I'm deleting your messages. I don't have
time to waste with you. SCUM BAG.

There is some connection there. Admittedly, the idea that you have to be a programmer to be a "real ham" is pretty stupid, but that does not take away from the fact that many good hams are programmers.

What is Ham Radio?

Ham Radio is a technical pursuit for those who are interested in the science of radio wave propagation and who are also interested in the way that their radios function. It has a long-standing tradition of providing a source of engineers who are born naturals.

Ham Radio awakens in its aficionados a whole-life fascination with all things technical and gives an all-abiding curiosity to improve one's scientific knowledge. It's a great swimming pool, please dive in!

This excitement causes a wish to share the experience with ones fellow man, and shows itself in the gentlemanly traditions of Ham Radio.

Radio Hams are qualified to design, build and then operate their own pieces of equipment. They do this with gusto, and also repair and modify their own equipment.

The excitement that drives a Radio Ham starts with relatively simple technologies at first, perhaps making his own Wimshurst machine and primary cells. Small pieces of test equipment follow, possibly multimeters and signal generators. Then comes receivers and transmitters. It is with the latter that communication with like-minded technically motivated people takes off. The scope for technical development grows with the years
and now encompasses DSP and DDS. There is also a great deal of excitement in the areas of computer programming to be learnt and applied.

The technical excitement motivates Radio Hams to compete with each other to determine who has designed and manufactured the best-quality station. This competitiveness is found in DXing, competitions and fox-hunts.

-----OOOOO----

However, beware! A Ham Radio licence is such a desirable thing to have that there are large numbers of people who wish to be thought of as Radio Hams when, in fact, they are nothing of the kind! Usually such people are a variation of the CB Radio hobbyist; they buy their radios off the shelf and send them back to be repaired; they are not interested in technical discussion and sneer at those who are; they have no idea how their radios work inside and have no wish to find out; they are free with rather silly personal insults; they have not satisfied any technical qualification and their licences prevent the use of self-designed-and-built equipment.

These CB types engage in the competitive activities with their Cheque-Book-purchased off-the-shelf radios in a forlorn effort to prove that they are Radio Hams.

No _REAL_ Radio Hams are deceived by such people!

The spirit of Ham Radio is doing the technical things for yourself.

Anything else is CB Radio, perhaps in its insidious form of the CBer-Masquerading-As-A-Radio-Ham

```
Perhaps those who replied below are closet CBers - did they
buy their rigs off-the-shelf and do they send them back to be repaired?

Well, I have been back reading the amateur radio newsgroups for
only about two weeks after abandoning them quite some time ago.
I see nothing has changed.  I have better things to do with my
time.

As you can see, this message actually came from uni-berlin.de, so this 'person' is a troll and probably a kid.

Hey kid, what language do you program in? Are you a real programmer? (The answer is no, because until you get out of school, you don't get paid to write code.) So you're not a real programmer, just a kid.

Bullshit. The spirit is to have fun, something you are obviously missing with the level of mental retardation you are displaying here.

> Anything else is CB Radio

If you're not having fun, then why not find a new hobby?

Well Duh on me. My son and I did a father/son project some 25 years ago and all this time I thought I was a real radio ham. Is there another type of Ham other than a real radio Ham? That is the only type of Ham you ever mention is a "real radio Ham". I must be what ever is left on your list of "Hams", I surly can't design and build anything close to the equipment I operate, my son can't either, but then he is only a computer engineer, not a real Ham engineer. Actually, I can't design any real ham equipment. I did copy and build a keyer out of QST that a real radio Ham designed and built, and a Ten Tec 40 meter QRP transceiver, but alas, it was a kit. A real radio Ham person designed that beautifull thing and all I did was put it together following some very easy step-by-step instructions provided. But I tell you I felt like it's proud father when it worked when I tried it out! When I get to heaven perhaps Jesus will be my Elmer and help me become a real radio Ham. I sure love this hobby. I just hate that I'm sooo,....DUH!

<snip>

It can still be a helpful resource with a little help from your newsreader's filter file.

In other words, don't let the Beaner, or any of the other rude posters, upset you. Usenet is as full of kooks and trolls today as it was when it came into being (probably more so, actually). This group is no exception.

Are there any high speed (128 or 256kb) packet kits (PCB + hardware/components) available for the 70cm or 23cm bands?

Would need a full kit including the radio and digital section so I can plug the computer in one end and the antenna in the other.

I have searched the web and can't find anyone selling these things for a reasonable price.

Reading through what you wrote again - the concept of
"Jesus" is one hell of a big con trick. Religion is an escape
route for the mentally questionable, and was completely routed
in 1957 at the launch of the first Sputnik (by the Russkies, BTW, whom
the Yanks having been trying to catch up with in technological
advances for years) when no angels sitting on clouds nor anything
else as described and claimed by the religionists was found
above the blue sky.

Actually, I've been on USENET since the days when news (and email) were
moved around over 300 baud dialup lines in the middle of the night when
the rates were cheaper (anyone left here who remembers UUCP) and it was
not full of kooks or trolls.  They are strictly a modern phenomenon tied
to opening up the INTERNET to all the idiots.

4.2!!!   USENET goes back to Seventh Edition and UUCP all the
way back to Sixth Edition.  Not sure which "Notes" you mean,
but I sure don't remember anything offering "competition" to
USENET News.  News continues today even through the extremely
bad (and getting worse) S/N ratio.

I hope members of this group can help me. I am in the Army National Guard and I am charged with setting up emergency communications for my unit. I need a transceiver that has a wide frequency range that can be issued to our civilian emergency responders for commo with our land mobile units (we cannot issue our military radios). I am looking for approximately 60 MHZ thru 500 MHZ.

Any suggestions?

Thanks!

They wouldn't be legally able to operate such rigs. Best bet is to give them one band, say 2m, or 70cm.

Here's what I would do: I'd get a bunch of FRS radios and a crossband repeater (70cm to 2m) and then put a beam on the 2 meter frequency to the EOC or to another repeater.

That way you can have cells of users talking to each other on FRS, and the crossband will relay their communications (with the crossband in a remote Van, or otherwise local to the FRS users). Given a 50 watt or 150 watt amp, you should be able to get pretty good range on 2m.

Hi I have a Kenwood TM-741A Tri-Band Mobile Radio

It Has The 144 mhz Module and the 440 mhz Module Installed..The 144 mhz
module is not functioning...The 440 mhz works fine and so does the rest of
the radio...complete with owner/ operator manual...

Make offer...

Carl

He should check.  If he's operating under military authorization, then it's
quite possible he's allowed to do this.

If not, then I don't see how he's allowed to do it at all in the first
place,
REGARDLESS of the radio he's using.

And why in the world suggest FRS?  The new kiddie/CB band.  At least
go GMRS with the higher power or MURS.  Better yet, get an itinerant
authorization on UHF.

Mike

You can buy 100 of them for the price of just a few GMRS only radios,
and get GMRS and FRS in the same radio.

Then you get to pay for all those GMRS licenses, unless you
live in one of those areas where everyone is related.

For Sale:
Kantronics KAM XL.

Unit is about one year old with all original packaging and accessories. I have been running it with PacTerm 98 software.

http://www.kantronics.com/kamXL.htm

Perfect condition. Pics available, $255
Jeff

You mean the 'combined' FRS/GMRS radios that cover both services but
are still limited to FRS only power levels.

Not much better. At least the GMRS only radios allow you to go 2W of
power.

Although it probably won't be long until there's a radio that does
selectable

power on the GMRS frequencies, and low power only on the FRS only
frequencies.

By the way, I picked up a 'blister card' with 2 GMRS HTs on it at BJs for
$25 after rebate. Granted, that was last year. The 2W units...

I guess my main point was that most emergencies are very local, and just need
a crossband repeater to get out of the hole. Don't buy a 60 to 500 MHz radio,
and don't buy radios that cost $150 a piece. Get a whole bunch of radios that
you can throw away when they break, or get stolen.

Bummer about the virus aspect... probably a good idea to stay away from
these titties.

At first glance the message seemed rather off-topic for radio
newsgroups. However, I suppose this unconventional use of silicon could
make it slightly on-topic. Silicone is certainly a more common material
for boob work. Silicon seems a bit hard and brittle for the task. The
new knockers must have been expensive, though.

Does anybody recognize the closing word? Looks vaguely Eastern-European.
How does one pronounce it? (I know... "just like it's spelled.")

There is a Linux version of FBB, by the way. If you don't like DOS, don't run it.

Install minimal Windows 95 / 98 / 98SE / ME.
Edit appropriate files (msdos.sys e.g.) to boot to command line.
et voila you are running DOS version 7.x.
This will work just fine.

If you really really need DOS 6.22 or DOS 3.2 or whatever,
go to eBay and pick up a copy or visit your local thrift shops
and paw through the old computer junk. Of course you could
also run freeDOS (surprise! It's free!) or Caldera DOS or
any of various other flavors. They also work just fine, and
can be downloaded or purchsed.

Google for "purchase dos 6.22" and you will find dozens
or perhaps hundreds of places to purchase dos ;-)

Greetings, fellow amateurs.

I realise that this question is not about amateur radio digital but you may be able to give me some directivity...

I have been trying to get back into amateur radio for the past year and am having a great deal of problems with my computer high speed modem.

Today I connected my hf radio to my outdoor antenna, random wire, and the s meter was reading about mid scale.... s7 ish.

I unplugged my highspeed modem and the s meter went down to about s 1. S 1 being atmospheric noise, I assume..

Does anyone know how to get rid of the modem noise? without disconnecting it....

Larry ve3fxq
larya@rogers.com

p.s. I have not contacted rogers, as yet, but plan to soon....

Try replacing the wall-wart (the power supply) of the modem.

My modem use to only cause noise when it was idle. When I connected to internet the noise dropped..

Tried a toroid in the power line and that reduced it 90%. Didnt try anything further because I went to DSL. I'd suspect a bit of bypassing around the power input would help.

Cheers Bob VK2YQA

Hi Marcus,

I guess I must be a cheapskate.  Iwas after a reasonable price.  As far as I
can determine for these you have to buy the radios and modems separately
and 2 of each would cost $4,500 Australian even as Kits.

It would be both simpler and cheaper just to get two Icom ID-1s at $4,400
for the two and plug them straight in.

One of the mail reasons I was asking about kits was to find a less expensive
alternative.

Michael

I have purchased a used Handi Packet and am waiting for it to be shipped. I've ordered a manual from PacComm, but I'd like to find more information while I'm waiting. Google didn't turn up much of anything.

I think it uses an 8 pin mini-din on the radio cable. Is the cable end male or female? What type serial port does it have for the connection to the computer? The KPC-3 and PK-88 that I have use a 25 pin D shell female on the chassis. I'd like to get parts together for cables while I'm waiting for the tnc and manuals to arrive.

Thanks,
Mike kc9doa

Hi.

The USB modems look great but I think you need a transceiver to go with them.

The T7F radio on that page has a maximum baud rate (bandwidth I suppose) of 19.2k plus it does not have a price.

What sort of radios do you use the USB modems with and where can I get them?

Looks like I'll have to figure out how to get AX25 going on a linux machine.....

They seem to have a good network in Slovenia [well at least before we dropped a heap of bombs on them] and some designs on the net http://lea.hamradio.si/~s51kq/PACKET.HTM but I don't think I could build something from scratch at 1Gig or above. I don't have the metalwork

facilities or PCB facilities and find it hard to source parts (no nereby
electronics store).

There appears to be a "concept design" at http://www.qsl.net/n9zia/900/ but
they say no radio had been built.

I wonder what radios people use witht he Baycom USB modems?

Um, we (presume you mean US/NATO) have never bombed Slovenia, at least
not since WWII. Not even close. Serbia, which we have bombed recently,
is on the other end of what was formerly known as Yugoslavia.

Thanks for the correction then.

Do you know where I can get suitable radios from?

I have used this company's 900 MHz products (115.2 kbps) with great success.
There are less expensive equivalent alternatives available, but these
are reliable and meet their own specifications. I see they are now
advertising 1.3 GHz products for "military", but presume they would have
no qualms about selling them. You'll have to request a price quote.
The 900 MHz stuff is reasonable, but not cheap. Don't know about the
1.3 GHz stuff.

Why would you want to handicap yourself like that? You'll get better
performance on the air with FlexNet, and performance is the desired factor,
eh? Running the AX25 stuff in Linux gives you the latest in packet radio
from the mid 1980's. Things have significantly improved since then, and it
would be a shame to see you spend good money on equipment and then cut your
own throat by going cheap on the software.

Can you provide a link to the specification for the FlexNet
routing protocol?

Is there support for Kantronics TNCs?

Thanks.

These appear to be in the ISM (licence free) band -not high speed amateur
packet radios - and are limited in their power output. In Australia at
900MHz our limit is 1W ERP.

I priced the 900MHz ones from the Australian disributer and they were $1600
for the serial version or $2800 for the ethernet version.

I wonder how much they are in the US?

I noticed that not very many Hams made comments to the rules changes
proposed. Organizations like TAPR made no comments on the digital
and spread spectrum proposals.

Those that did comment were pretty typical in their replies. Same old
fears, same old status-quo.

Very sad...

I had a bit of a go with FlexNet a couple of years ago. I don't know what its like now but back then it was a DOS application for a windows machine. It would not run properly on a protected machine (I was mainly using NT4 at the time - now I only have XP or linux).

I did manage to get it going on a windows 95 or 98 machine but could not manage to figure out how to get it to work properly.

They claim that these radios can work over 10 kilometers (6 miles) using
20mW output with a receive sensitivity of -95dBm.

I wonder if that is realistic.

The more expensive ones transmit 1W.

Howdy folks
I have a infotech M600 decoder and M605  FDM demodulator   it does Rtty
morse code etc
I do not know if it works but it did when I  got it.
I am open to offers. the M605 is very rare I have never seen one on ebay in
```

fact only on one site on the internet.

Lee.

I have used the Freewave 900 MHz units for a mountaintop to aircraft
application (no foliage) with ground plane antennas at both ends an
maintained a reliable link to 20 miles. Mountaintop to valley
performance was reliably 10 miles in desert (no foliage) terrain, line
of sight.
The 900 MHz units are cheaper if you don't buy the weatherproof case.

Sounds like your local distributor is trying for a 60% markup on the
cased 900 MHz units.

Thank you for taking the time to read this.

Your Freedoms are in jeopardy! RadioShack Corporation has filed an
injunction in a Texas Court that has shut down an opinion website,
http://www.radioshacksucks.com, in direct violation of the Freedoms of
Speech, Expression and Peaceful Assembly, as guaranteed to us by the
Constitution of the United States. If other companies learn of this, they

will use it against any website that speaks out against that company. This is extremely dangerous, as it will change the face and scope of the Internet.

If Big Business continues to dominate our lifestyles, we will lose our freedom to worship as we see fit. We will lose our freedom to vote for the candidate that we think will do the better job. We will lose our freedom of the press to accurately report on current events. We will lose everything we have fought and died for in the past 228 years Do not tell this to the descendants of those that have bravely fought in previous battles and wars, for their ancestors would have died in vain. The Constitution will have been overruled by Big Business.

RadioShack is on a vicious witch hunt and will not stop until they dominate our lives. RadioShack must be stopped now, before it gets any later or any worse.

Here is what you can do to help: copy this letter and add your signature to the bottom. Mail it to the following people:

Leonard H Roberts
CEO RadioShack Corporation
100 Throckmorton Plaza
Ft Worth, TX 76102

The Honorable Kenneth Curry
401 W BELKNAP
153RD DISTRICT COURT
FORT WORTH, TX, 76196-0225

Thank you for your help and support.

Radioshack wants to dominate my life?  First I'd heard of it.

Get a grip on reality!

What's wrong with Radio Shack, anyway? I bought something there both
yesterday and today. Had what I wanted a cheap enough. No problems.

Anybody can sue anybody. Why should this upset anybody. That's the
American way. Sue enough people and you might even become a
politician......maybe even a presidential or vice-presidential
candidate. My freedoms are certainly not in jeopardy because RS sues
somebody....quite the opposite. This just shows what freedoms we have.

(from alt.tasteless:)

"...you'll feel a slight pressure"

Saddam needs a urologist:

http://www.cnn.com/2004/WORLD/meast/07/29/saddam.ap/index.html

"Deposed Iraqi dictator Saddam Hussein suffers from a chronic prostate infection and has refused to have a biopsy to rule out any chance he has cancer, an Iraqi official said in an interview Thursday on Al-Jazeera television."

--------- cut -------

Uhhhh, gee ... why would Saddam possibly object to a prostate biopsy if he's having problems? Wouldn't *you* want a prostate exam from a coalition forces doctor? Hey, I wonder if Lynndie England is available with her big industrial rubber gloves?

Keith

Check this out, in order to understand what is being discussed, here:

Reference: http://www.arrl.org/announce/board-0407/

The ARRL set up a committee to look into digital communications for ARES last year.

Talking to one of the committee members early on, not long after this digital group was assembled, I was told that two or three affluent and powerful members of the committee had already decided the group's final conclusion, to utilize the Winlink 2000 system for ARES HF communications.

The six months or so that the committee "studied and discussed" the matter were a formality, a sham.

I know of three persons who attempted to inject a note of sense into the issue, but all attempts to suggest that anything other than Winlink2000 be used were rejected by the committee, often rudely and in one case the rejection involved name-calling and ridicule of fellow Hams that was entirely uncalled-for.

A note of sense? - As a digital experimentor, I know that finding space anywhere on the Ham bands to operate the new wide digital modes like PACTOR II and PACTOR III without interfering with other Hams is extremely difficult.

A PACTOR III signal is six or seven times as wide as a Packet signal, for example, and fifteen times wider than PSK31. - This proposal calls for dozens and dozens of these stations operating from NWS EOC's around the country - if the committe were being honest about its intentions.

The committee was not being honest about its intentions though, which may explain why repeated attempts to talk sense to this committee failed.

Not being honest? - Take a look at the pdf file describing the committee's plans:
http://winlink.org/Emergency.htm While you are there, do a word-search on the word "future" in the article. - You will find that as often as not, the word 'future" is used in the article to describe the HF links in this system. These "future" links are the ones I mentioned earlier, the ones that knowlegable hams tried to warn the committee as to the impracticality of. - The impossibility of getting that many wide-mode digital stations on the air for any purpose without causing massive interefence of every other ham-related activity on the air.

The thing is, you see, that the cynical members of this committee knew that they could ignore warnings about the chaos that multiple wide-mode digital signals would cause on our bands - because the comittee never intended for this system to use Ham Radio in the first place.

That's right; This is another one of those "Amateur Telephone" scams, where Internet junkies put Amateur Radio traffic on the Internet and call it "Ham Radio" because the data was taken from Hams. They lied about it because they knew that if they told the truth, thier non-ham ideas would be laughed right out of the hobby. Winlink2000 is another one of those "ham radio digital modes" that could not exist or operate without Internet linkages.

Yes, the ARRL actually decided that we as Hams should back up the Internet - by using the Internet. (Duh!)

In other words, these people have no clue whatsoever about emergency communications - but they are going to force their ingorant, anti-ham policies upon the Amateur Radio community anyway - with the help of the ARRL. - The result will be that all Hams will look like idiots, not just the members of this "committee".

What has this got to do with the ARRL's decision to "take over" ARES, it's logo and all of it's operational issues? - It is so they can cram this cynical non-radio solution down the throats of Amateur Radio operators who are really more interested in trying to use Ham Radio.

ARRL: The hobby is "Amateur Radio", not "Amateur Telephone"... Get it?

Take-overs like this are usually motivated by a desire to force something upon people against their will, and this shameful takeover attempt on ARES by the ARRL is no exception.

I call it an "attempt" because ARES members across the country are already up in arms over this ignorant, cynical and destructive crap.

If you know any of the great Hams; The real Hams who pass emergency traffic every day on HF, please send them a copy of this via E-mail. That way, when they have been pushed aside to make room for "Amateur Telephone" operators who do not even use radio, they'll know how it all happened, and why.

It's another attack on the hobby by cynical Internet junkies, aided and abetted by the ARRL, as they did with Packet Radio. We all know how Packet Radio ended up after this treatment... Now the same "wisdom" is being applied to ARES.

Isn't that "special"?

Hey, the ARRL is made up of humans, and is not by any means "all bad"... Why not give the president of the ARRL, Jim Haynie the benefit of the doubt and let the gentleman know how you feel about this matter? His E-mail address is: w5jbp@arrl.org

Usually when I see someone bitching about Radio Shack it's from one of
the small brained no-lifers who get their kicks from going to Radio Shack
and trying to show off how much more technically intelligent they are than
the clerks behind the counter.

Unfortunately, I can't make an assessment of your web site to see if it's
of the same ilk, because it appears to be shut down.

Awww.....

Let's all say 'Too F...in Bad" in unison. Doesn't seem like you're getting
the
internet support you wanted!

If you don't like Radio Shack, why do you go there?   Unless, of course,
you like the abuse you think you get, and go just to get more ammo!

Wait, I didn't come here for abuse, I came for an argument! Arguments
are two doors down on the right.

Well, I find it hard to believe that, in a weak moment, I visited the site mentioned below. It is obvious that a great deal of time and effort has gone into this thing, and to what cause? To save our rights? Me thinks not. What rights are we having trampled? You're right to slander RadioShack?   That right is only in your mind. You are most likely a relatively well educated individual with many personal conflicts in his life and I feel deeply for you, but mostly your parents and family members. They most likely put up with your drivvel year after year and detest the site of you.

Why don't we just cut to the chase, and you explain, in a very short sentence or a very, very short paragraph what caused you to create this Radio Shack site that you claim sucks so bad that it has obviously destroyed your life and those of your loved ones? When They haven't harmed you. You are harming them by saying to the world that they suck.

I have enjoyed Radio Shack for many years. I was there when they became RadioShack, and I became a valued customer (I believe that because I still get free catalogs in the mail, not many do anymore 'ya know) to them and grew through the whole gammit of stuff they have added over the years and I must say that when I had a problem with a product, and that was extremely rare, they took care of it. In one case the manager returned my money because it was a last item and he couldn't replace it. A few years later when computers came along if this had happened, they could check all the stores in their system to see who still had it on the shelf and that store would mail it to me at my home. Is that cool? I say "Yea Verily".

I love Radio Shack. This little reply is probably enough to get you to open up KF5DEsucks.com I won't sue you unless you get nasty. All my friends will check in and post there I'm sure they will have comments to make there, they have a lot of freee speech to use 'ya know. I have a friend that can enlist, in moments hundreds of hackers that believe in not only free speech but free hacking tooo!! Free viruses', free wurmzs, 'n free other stuff too.

After that you can open up another site, KF5DEreallysucks.com

Or, you can channel your efforts into something productive and usefull
and possibbly profitable for yourself and your suffering family which
will no doubt heal many open wounds.

Butch Magee, KF5DE
Diamondhead, MS 39525
wow, just can't believe i'm gonna push that send icon.

I picked up a couple of YDI AMP2440 2400 MHz Bi-Directional Amplifiers
at a Hamfest over the weekend. Problem is, no DC Injectors! Anybody
out there have some loose ones? Or know how to make them?

Please email. Thanks for reading,

Mike Nowlen

I have used it on hf in all modes with little trouble. Drop me a note on
  my e-mail and I will see if we can get it to work.

I have a similar situation. What did you use for the USB to serial
adaptor? I am using TRX-Manager for rig control, and have to unplug
that from my sole serial port to use the Rigblaster.

Based on your experience, what's the best way to go?

Why. You have to run the thing to catch it. I have the defaults
turned off, I use Agent as a news reader, and Firefox as a Browser..

You should see the code in some of these. They are adding Netscape as
well as Explorer.

Did you see the One Page Add by Icom in QST?

Please visit the Icom Website and download the videos.
http://www.icomamerica.com/amateur/video/

The first two videos gave a great overview of Dayton from an Icom Marketing perspective.

The third video was an great production demonstrated by two teenage amateurs
Trevor and Sara.
I would like to suggest you put this video on a CD and send your kids to
school with it and let them play it for there friends.
Play it at your next amateur radio event for others to see.

I would like to thank John Webb - W7NWH and Icom for producing these videos
to help promote the hobby.
Wouldn't be great to get something like this on TechTV or get a corporate
sponsor to use this to market our hobby as well as there product.

73's...

Does anyone know of a commercial cable for interfacing a KAMPlus to a
Kenwood TS-950SDX for FSK?

I see cables for AFSK available, but not for FSK. This is for the 13 pin
connector on the back of the radio to the TNC.

Thanks.

Herb - KG6OK

Well to tell the truth, I have seen this crap in dozens of newsgroups
that have nothing to do with ham radio.

Charles, N5PVL:

I'm sure very little thats politicised is ever straightforward!
I read a long story in the Raleigh newspaper that showed the local ham
club working in the field with the power company to insure fcc

compliance and a ham-friendly relationship. This arrl clip was from
may'04. My recollection was that the news story was about the same time.

Its about time for an update.

Here in Raleigh NC, Progress Energy has closed down the BPL testing for now.

Duke Power Co. and other companies in the state plan on testing their BPL.

What does the "N" stand for in your screen name? I bet it's what you want us to believe it is. I think you are a very young, very angry teenager without a clue to anything yet. You do not even know what little you understand about bpl must less ham radio.

It's time again for the Texas Balloon Launch Team (BLT) to fly their 20th mission.

The Primary GPS APRS transmitter is on 440.950 Mhz FM

The Backup GPS system transmits on: 445.925 MHz FM

There is also a Crossband voice Repeater on the balloon which transmits on 446.000 MHz FM

In addition there will be a Live television Camera transmitting its signal on
1255 MHz FM

The balloon will take about one hour to rise to 100,000 feet where the balloon explodes and the electronics payload parachutes back to earth for another hour. You should be able to hear the balloon transmitting from over 300 miles away.

They will launch from the same airport in Wharton Texas (http://www.airnav.com/airport/5R5) on Saturday morning at 10am and will use most of the same equipment as BLT 19 last year. If the frequencies or launch site change then I will post another message by Saturday morning.
The airnav web page shown above has a handy distance calculator where you can enter the code for your local airport and it will tell you the distance from wharton.

The GPS coordinates transmitted from the balloon are used to locate the landing site.

The electronics package is also fitted with a Piezoelectric beeper to help the recovery
crew find the payload in "that last 100 feet of tall grass".

See the photos from previous missions at:
  http://www.qsl.net/w5acm/b18_1825.html
  http://www.qsl.net/w5acm/b18_1826.html
  http://www.qsl.net/w5acm/b18_1827.html
  http://www.qsl.net/w5acm/b19.html

For all the non hams out there:

The GPS data is transmitted in APRS format.

To learn more about APRS click here:
http://www.tapr.org/tapr/html/sigf.html
http://web.usna.navy.mil/~bruninga/aprs.html

Receivers are available from Ham radio stores such as Amateur Electronic Supply http://www.aesham.com/   or Ham Radio Outlet http://www.hamradio.com/ Or you could look on Ebay for a 440 MHz FM receiver. You can also get a police scanner from Radio Shack to do the job. Make sure it receives the proper frequency.

You also need an antenna. I recommend the arrow antenna to get started:

http://www.arrowantennas.com/146-437.html

You will also need a packet modem to decode the APRS audio tones. The Kantronics KPC3 is an example http://www.kantronics.com/kpc3+.htm These units plug into the speaker jack of the receiver and also to the RS232 serial port of your computer.

Or you could try to decode the audio tones with software and your sound card instead of buying the modem above. Check out these web sites for packet software:

http://www.qsl.net/soundcardpacket/
http://packetradio.com/rascalmkv.htm
http://www.elcom.gr/sv2agw/agwsc.htm

While the blog entry sounds like a call for tolerance, USPacket seems to be simply an advocate for AX.25 (forgive me if I err; I have been away from the field for a while). There are reasons and places to use other protocols, although AX.25 on VHF appears to be a good entry point for the newcomer.

Back in the olden days I ran an Aplink station, the only one in the DC area. I dumped my local traffic mostly to a large local BBS that also ran HF packet. The local head of NTS picked traffic up off both of us, and dropped some, I think. We just quietly pooled our resources and kept our mouths shut to the warriors. That seemed to be winning the protocol wars for us.

I'm also an engineer, and find the protocol battles, at least, useful. Any protocol is a compromise of multiple needs. Where the channel characteristics vary as much as they do on various amateur radio bands, and on individual bands from time to time, it is no wonder there is heated debate. For some of us, that is what makes it interesting.

The point is to make all transport and all services available
no matter what protocol any given user chooses. That is
not the case at present, and many of the missing links are
missing intentionally. "Our protocol is better than yours,
so we refuse to allow a link to *our* network from *your*
network."
```

Exactly. Here we have interoperability between ax.25, tcp/ip, pactor.
However the pactor systems do not allow user transport but will
handle messages to / from ax.25 and tcp/ip systems.

That's why we need to be careful to design all the layers of each
protocol in such a way that they can interoprate at layer 7, and
preferably at layers 3 and 4, so as to provide transport for the
users. Turns out it is not all that hard to do ;-)

Hi.  Is there any way that someone could experiment w/ RTTY w/o a HAM
license?  Perhaps w/ a MUR?

To answer the why question, just because I'm curious.  Thanks.

El Cheapo CB handi talkies.
Low power version under Part 15 rules.
Will work fine for experimenting over a couple hundred feet.

Thanks for the kind follow up. I thought the FCC didn't allow any digital
transmissions on the citizens band (CB) frequences? Maybe it changed?

How would one go about setting up communication, say from his laptop (in

```
the field) to a desktop in a house?  The ranges would be very short.

Thanks.

Why not just use wifi?

MURS frequencies are limited to two watts power out, no matter if you're base or mobile.

> To answer the why question, just because I'm curious. Thanks.

I guess the answer would be along the lines of "I guess you could, but why bother?"

Getting an amateur license at least gives you some of the electronics background you'll need to enjoy such experimentation a lot more than you might otherwise.

Happy hunting.

Thanks again. For actual use I will be likely using wifi, though I will have to overcome some distance issues at certain points.

I just like to tinker. RTTY is something I haven't ever tried, so was just curious. Thanks.

I've been thinking of getting a HAM license for a while know. This might be a
good reason. Thanks for the reply.

You're most welcome. I would suggest contacting whatever ham club is local to your area. Such clubs frequently teach classes designed to bring newcomers into the fold, as it were.

For a listing of clubs, visit:

http://www.arrl.org/FandES/field/club/clubsearch.phtml

Input your state of residence into the search widget, and you'll get a complete rundown of ARRL-affiliated clubs in your area.

Happy hunting.

The balloon was successfully launched last Saturday. It reached 83,000 feet over Texas before the balloon burst and the electronics payload parachuted back to earth. Amateur radio operators were heard talking through the cross band repeater from Galveston, Houston, Dallas, Austin, and Rio Grande. Recovery was as simple as entering the last broadcast GPS coordinates as a waypoint into a hand held GPS receiver and following the arrow to the landing site. Conveniently the package landed only a few hundred feet from a paved road.

Watch for future balloon launch announcements at:

I have just purchased a KAM XL... I was a little disappointed to see no manual except the one on CD. and that cables are all kits. Any way my question is; Does anyone know where I can get cables already completed to hook up the KAM XL to the Kenwood TS-2000X. If not would anyone have an accurate schematic showing the wiring from the DB 9 plug to the 13 pin Kenwood plug. Any information would be greatly appreciated.

Start learning about the exciting world of APRS with APRSPoint, the APRS software regarded by most hams as having the best map support and most intuitive user interface. Track other hams on a zoomable, street-level detail map in an intuitive and easy to use interface. Send instant short messages through either RF or internet link. If you are an experienced APRS user, you'll appreciate the ability to plot a digipeater or other ham stations' signal range on the map, connect to APRS internet servers, send email through your ham radio, and other advanced features. This week you can get APRSPoint with MapPoint 2004 included for the best possible price ever. Check out the website at http://www.aprspoint.com/ for details.

Hi guys.

For those interested in playing with new bbeta softwares, JE3HHT of MMSSTV fame has released an interesting software which you can find on my downloads page.

http://www.g3vfp.org/downloads.html

Check out multimode software section.

Have fun and enjoy

Dave G3VFP.

I've been looking to see if I can find any news broadcasters like
Reuters or AP still using teletype.  I have not found any so far.  Is
anyone aware if commercial broadcasters still using teletype?

Thanks,

   Nah, this stuff is on satellite these days.  I've seen once in a
while receptions of stuff from the Philippines and Argentina, but it's
very very rare.  73s  Mike

Too bad.  It looks like SITOR B and NAVTEX would make a good news
clippings distribution method.

I think it is too hard to encrypt, and it is less reliable than satellite.

There have been a fair number of different signalling
schemes like this in use. Google PICCOLO and/or MFSK,
will get a lot of references.

Lots of different kinds of problems to work on depending
on who wants to use digital communication for what use.

I'm looking for an AEA DSP-2232 or 1232 in good operating condition. If you
have one you'd like to get rid of, please email me at jcamp2@cox.net. I can
pay cash or also have lots of radio stuff to swap if you'd rather do that.
I already have a manual, so I don't need another one.

Thanks and 73,
Jeff

> These interfaces make the process easy and safe

I always cringe when I see a licensed amateur make statements like that.

Connecting a computer to a rig is a trivially simple exercise. It is hard
to really get engaged in studying the schematic for commercial gear, so one

doesn't really know, at an intimate level, what is happening. In that case, the connection and operation is decidedly less "safe". The manufacturers of these things have been succesfully convincing the clueless that somehow you are going to fry your rig or computer if you don't take advantage of their magical expertise. BULL.

For me, I find that without that intimate understanding, there are always little operational quirks that make the thing very much less "easy". Even if my homebrew thing is kind of a kludge, I understand intimately it's quirks, so they never really get in the way.

All that being said, interfaces like the Rigblaster are well packaged and neat, and often offer a variety of connection and switching options that can be quite convenient. Vitrtually all of them are cheap enough that for many amateurs, it may well be worth the price for the pretty box.

Keeping the station well organized and neat is important, and even the aesthetics have some value.   Recognize that in buying a commercial interface, you are actually loosing a certain amount of ease of use, but you are gaining a pretty box and a couple of hours of time. The price of these things isn't a lot different than the price of a decent metal case, so I'm not arguing that they are too expensive.

But the safety thing is a crock.

Thanks guys. This site especially looks useful.

I did make a cable, and went ahead and used VOX, at least for my first
try. And I can report that I've made my first HF contact (ever!)
tonight, at 14071 mhz using the PSK31 mode, using gMFSK as the
software. :)

Our GOTA station will have PSK31 setup at field day to show digital newbies the fun of the digital modes.

Naturally we want to make QSO's there for the GOTA station.

What can we expect in the way of a crowded band and ease of contacts.

We will run 50 Watts into a Cushcraft R8 antenna.

Suspect 20m will be best but will try the other bands.

Wonder how many 40M PSK stations on FD you have experienced.

Have not heard any PSK on 10M or 15M all week (:-(

Thanks for any help

Am anon here by necessity, so a reply here please.

Never ran digital on FD before, this is a first for us. Will be running psk31, rtty, psk63, and possibly other modes.

>
> Have not heard any PSK on 10M or 15M all week (:-(

Same here... but then again I have not been all that active this week either, just one short qso last night on 20m psk.

rec.radio.amateur.dx:237

"The limit for an unintentional emitter on HF is 30 uV/m at 30 meters from the source," he said. "If you take a dipole cut for 3.5 MHz and put it in a 30 uV/m field, you'll have a noise reading of S9 plus 16 dB at your transceiver."

The FCC has extended the comment period for BPL. If you value radio, this may be the last and only chance to have your voice heard to stop BPL from destroying your hobby. The FCC has extended the comment period for BPL.

It is VERY simple to file a FCC comment. Click the link below and enter

04-37

in box #1 (proceeding number) and fill in the blanks. The simplest way to comment is to type your comment into the box on the bottom of the form. Sample comment below.

http://gullfoss2.fcc.gov/prod/ecfs/upload_v2.cgi

If you see fit, please post this to as many groups as possible
because numbers count! Please mention this in your nets!

More info at http://www.arrl.org/news/stories/2004/02/12/5/?nc=1

If you can't think of any thing to type or wish to make this as painless as possible, you can cut-n-paste the comment I typed below.

/******************************/

In Writing, I wish to persuade the FCC from allowing BPL to be implemented. The destruction or at the least, deterioration of the shortwave bands is not only a violation of ITU laws that protect international broadcasters from interference and jamming, it will be destroying many people's life hobby. Amateur radio will be reduced to users with high-power amplifiers and large antennas. Emergency communications will be hindered to levels directly responsible for the loss of life. Also, this will hinder military HF comms reducing national security

There are many technologies that make BPL unnecessary. BPL will never be able to carry the high bandwidth demands for mass distribution of video much less the up-and-coming HDTV.

Thank You!

HELLO,
FIRST I KNOW ALL ABOUT TYPING IN CAPS BUT I HAVE MS AND SO I ALSO HAVE
VISION PROBLEMS.

THAT BEING TAKEN CARE OF, I HAVE AN IC-781 AND JUST BOUGHT A NEW PACCOMM
PACTOR CONTROLLER. I'M HAVING A DEVIL OF THE TIME TRYING TO GET THOSE TWO TO
COMMUNICATE WITH THE LAPTOP. I RUNNING TELIX IN THE COMMAND LINE MODE BUT I
NOW SUSPECT THAT THE LAPTOP MAY NOT BE PUTTING OUT ENOUGH VOLTAGE TO TELL

THE PTC-1 THAT IT'S CONNECTED. ALL THE LEDS LIGHT UP EXCEPT FOR HUFFMAN, HISPEED AND ERROR LEDS WHICH AREN'T SUPPOSE TO.

I HAVE THE PTC-1 CONNECTED TO THE ACC(1) SOCKET ON THE REAR AND THE PACCOMM SUPPLIED DB-9 CABLE TO THE LAPTOP. I DID TRY TO GET THE IC-781 TO SUPPLY POWER TO THE PTC-1 THROUGH PIN 7 ON THE ACC(1) SOCKET BUT IT DIDN'T WORK. CAN ANYONE HELP HERE? I'M TRYING TO GET THIS UP AND RUNNING SO I CAN PASS MORALE AND WELFARE TRAFFIC FOR ARMY MARS.

THANKS AND TAKE CARE.

Hi all

Using Linux, want to automate sending some audio streams over my radio equipment (Wyman1x/RDFT)

Its easy to use "play" on the wav file but I'd like to be able to toggle the DAT0 pin on the printer port to key the PTT. The port isnt used for printing!

Has anyone come accross or can direct me to something simple that will do this? I blindy tried to echo characters to /dev/lp0 but that didnt work.

The other possibility is to assert RTS on the serial port

SuSE 8.1

Cheers Bob VK2YQA

I just submitted the FCC comment below (in case it provides any useful ideas to other potential comment submitters).
I'm planning to follow up with letters or emails to my

congressional and senate representatives, per the ARRL pages.

"This comment addresses the proposed deployment of BPL (Broadband over Power Line) systems.

As a career radio frequency design engineer, it is obvious to me that widespread BPL deployment would cause massive degradation of most licensed radio services now operating in the HF (High Frequency) spectrum-and some services would be completely destroyed in the U.S.A.

This expectation follows directly from the fact that power lines at HF frequencies are poor transmission lines, but are quite efficient antennas. BPL lines will therefore radiate massive interference levels (by HF standards), and will themselves be vulnerable to interference from licensed HF transmitters. I am confident that my expectation in this matter is basically the same as any other qualified engineer who considers BPL objectively.

There is abundant evidence of the expected interference problems in BPL field trials around the world. And there are no examples that I know of where BPL is successfully coexisting with licensed, co-located HF radio services. For these reasons, BPL has already been rejected by a number of "HF aware" countries.

The HF radio spectrum is an extremely valuable natural resource with the unique ability to provide direct, world-wide wireless communication. It would be highly irresponsible to allow the destruction of this unique resource simply to provide a redundant and probably unreliable option for internet connections.

I urge the FCC to do the following:

(1) Provide rigorous protection for the licensed radio services now operating in the HF radio spectrum from unlicensed emitters like BPL-both through appropriate rules and through vigorous enforcement.

(2) Insist on thorough, objective, and successful field trials-designed to scrutinize interference potential-BEFORE allowing the widespread deployment of any BPL system.

Sincerely,

<signed>"

GO FOR IT, and good luck!!!

I am SM0UGT

For this purpose i have gone deep in my thoughts in full spectrum signalprocessing and
have made a papper with nodes that finds themselfs. unlike the current packetradio
modes - that is fix in frequency - and have only the concetion of reciving and sending
data. we have included in this design a sort of DSP system that works directly on
the HF band. We are a group named Wormnet taskforce and are currently looking
for people that works with modern digital design tools. Signaling is done thrught
a system where nothing is settled and fixed. each node has its own personality.

the system can inherent features from each other. No one is special client or
special server. All this is floats around, made by a desision table.

The point is that if you place out a radio - the radio will be aware of others automaticaly

it will even find other nodes. Information will be routed to the other end -
with out
any involvments from any other users than the system itself. Meaning
everyone will
be able to create a huge radiobased (universial) radionetwork. A deeper
information
package is avabile.

with other words - with the qoutes from down under I agree. Hamradio
enthusiasts
must build their own network and not releay on existing services; othervise
that
is false safty..

USPacket.Net is moving to USPacket.Org

Please change your web-links and favorites accordingly, as the USPacket.Net web site will go off into oblivion soon.

At USPacket.Org we have six times as much HD space and bandwidth to play with. The old site ran shy of bandwidth when new articles were published, particularly the Flex32 tutorial, which is both popular and graphic-intensive.

Now we can do more of that graphic-intensive stuff!

Come see the new, updated web-site at http://www.uspacket.org !

The management @ USPacket

Hi everyone in the group........I have a nice Kenwood TM-741A Triband Mobile radio...It has 144 mhz / and 440 mhz in the radio...However, the 144 mhz (2 meter Module is not functioning...The Radio has all the modifications...I have the owner / operator manual...I'm looking to trade the radio for Either a Johnson Killawatt Tuner...or a James Millen 2 killawatt tuner...Tuner must be in good working condition...and it would be nice if it was also cosmetically in shape....

Carl N2MFW

P. S. I will take cash if the offer presents itself...

HamBlog http://www.hamblog.com is a weblog host exclusively for amateur radio operators. The hosting service is free of charge.

Many hams have questions about blogging. If you are wondering what the bloggosphere is all about, there is a definition of blogging on our main page, along with a link to a very good blogging FAQ list. (Frequently Asked Questions) The information there will give you a solid footing as you step into the blogging world.

Why a "HamBlog"?

Hams have a lot of information to pass on to each other that traditional information systems such as magazine articles or speaking engagements at fests have proven to be unsuitable for. Weblogs are highly flexible and highly individualistic. It is our hope that the public weblogs at HamBlog will provide a wellspring of knowledge about Amateur Radio that would be impossible to access or distribute by traditional methods. Perhaps in some way HamBlog will expand the capabilities of our present "Elmering" setup, which many feel has suffered and diminished in recent decades.

As is the case outside of the Amateur Radio community, word gets around about outstandingly informative and useful weblogs. There is a global syndication system for weblogs that HamBlog,Com participates in, just as other blog hosts do. What is different about HamBlog is also the thing that makes it special.... It's all Hams!

If you are an Amateur Radio operator who would like to post a weblog of your activity for the benefit of your fellow Hams, where would you go?

HamBlog.Com, of course!

I'm not what you would call an expert on the bloggosphere myself, Bill. I've
```

looked around a little but can tell that there's a lot I haven't seen.

A weblog is a chronological e-journal. In function it is more like an Internet forum than like usenet, really.

One difference between a weblog and a forum is that a weblog plus all comments about it are contained in one file or posting, as opposed to each comment being a seperate file or posting in a forum.

In general, things are weighted much more heavily toward the author of the original post (blog) with weblogs. The blogger has options such as whether to allow comments on his blog, for example, or whether to do other things impossible with usenet or Yahoo. There is a global syndication system for weblogs, as another example of a feature unheard-of with usenet or web forums. Because of this feature, popular and useful blogs are propagated far and wide across the Internet. You decide as to whether to allow syndication of your blogs. - It's all about putting the options into the author's hands.

Weblogs are more versatile than the other systems, as far as I can tell. You have more options as to what it will look like and what it can be used for. I've seen plain-jane weblogs where the guy talks about chowing down on burgers while he crams for an English exam, and another weblog that had excellent artwork. I thought that if you clicked an image a bigger image would come up, but instead each image was linked to different music. Other weblogs are full of heavy, serious political commentary or what-have-you.

HamBlog is for Hams. - A place to talk and reflect about the hobby, or chronicle a large project, or suggest policy, or display instructions on how to build an amplifier, or any number of other projects that I can't image right now.

HamBlog is a blogging host where the emphasis is on Ham Radio... If you want to blog about Britney Spears, then Blog.Com would be a more appropriate choice. There are dozens of free blog hosts... This one is for Hams.

The main difference with a weblog is that you control your weblog page. You get a admin control panel and a display page. Only you can post to your weblog page, or edit your entries there. Other people can leave comments if you set that option for a particular post, but the initial descision to allow them to do so is yours.

Check it out!

That's a good challenge - if the system is so good, then why was there
a need  to advertise it in the Usenet fora which are its competitors, and
successful competitors, at that?

Having said that, many of the newbies to the Internet, the "M3's" of that
medium perhaps, have never heard of Usenet.

Hi!
As most hams will know DRM (digital radio mondiale) is the upcoming
digital shorwave broadcast standard. There are two different decoders at
the moment: the commercial by Fraunhofer - http://www.drmrx.org/ and an
open source project at http://www.sourceforge.net/projects/drm/
The open source decoder included a transmitter mode in the current CVS
version. With it you are abled to transmit slide show pictures but no
voice as there's no free DRM compatible AAC encoder. You also have to
modify your tranceiver for the 10 kHz bandwidth signal.
Now HB9TLK modified this software and included Hawksoft's LPC-10 audio
compressor - http://www.hawksoft.com/hawkvoice/ - to the DReaM proejct.
As LPC-10 allows very high compression rates (of cource not at HIFI
quality) the signal fits into a normal SSB channel so you don't even
need to modify your transceiver's filters.

Of course this is not a DRM compatible mode as it doesn't use AAC
compression and doesn't have the required bandwidth but it seems to
allow digital voice QSOs on HF with a standard PC/transceiver only.

DReaM runs under Windows and Linux and is released under the terms of
the GPL licence. You can download the binaries and the sources for free
under http://www.qsl.net/hb9tlk/hamdream

> successful competitors, at that?

I announced HamBlog.Com's service here. - And since no other weblog host specializes in providing that service to Amateurs, there is no "competition", or need to "advertise" as you so uncharitably chose to put it.

The idea of the announcement was to let hams know that this service is available to them, free of charge. - Hey, I just managed to mention it again. This is great! :-)

What makes the vision behind HamBlog.Com so good is not the web-site itself, but the content that a specialized web-log host for Amateurs like HamBlog can be expected to develop. In other words, the Hams who post weblogs at HamBlog.Com, or comment on the matters discussed in them are the thing that is so good about it. In time, a deep and diverse data store of materiel related to Amateur Radio should be the result. I don't know about you, but to me the idea is interesting, well worth the effort I have expended in putting this idea into action.

As for "competition", the emergence of other specialized blogging hosts for Amateurs would enhance, not limit the operation of HamBlog.Com, as that would drive an internal (Ham Radio) blog syndication system. Such a system would benefit every ham-related blog host that participated, enhancing the content available at all by propagating the most useful and popular weblogs across the network to multiple hosts.

It's weird stuff and I won't pretend to fully understand it, as I have been too busy getting the web site ready to spend much time playing around with it. Now that it's up and running, my next step is to do exactly that, so I can write up tutorials on the system. Remember that if I am above you on the weblog learning curve right now, it isn't by very far. I posted my first weblog not long ago. Thousands of bloggers across the country would laugh at my naive notions on this subject no doubt, but I'm not worried about that... I'll have to understand it all well enough to write the tutorials, a job that is coming right up.

Fortunately, you don't have to be conversant on all the nuts 'n bolts of blogging in order to use the service. Until I get the tutorials written up though, the only way to find out about about that would be to learn by doing.

>
> Having said that, many of the newbies to the Internet, the "M3's" of that
> medium perhaps, have never heard of Usenet.

Weblogs are web-based, as the name implies. The function of usenet is totally different from that of the "bloggosphere"... So much so that talk about them being in "competition" is pretty silly. All you can really do is to describe the differences, as each works best within its own niche. For my part, I don't intend to pass up on using either usenet or the bloggosphere, as my presense here in my capacity as the administrator of a weblog host implies.

Relax. There's plenty of the Internet to go around.

You must have been reading my mind somehow, Howard. That's exactly what I've been looking at, as it would be no problem to install at the same site and portal through the HamBlog.Com home page. I am definately looking into doing just that, but first I need to polish up HamBlog.Com with a few tutorials. It will benefit greatly from that, and besides that, I'm on square one with Wiki, just now finding out what they are and how they work. One thing I do know is that there are already several Ham Radio wiki around, so I won't be breaking any new ground there.

Usenet is pretty much the domain of senior citizens. Most young
people think these types of postings are about as exciting as a
glass of prune juice. Even if they heard of it, they wouldn't use a
stick to touch it, and get Geezer juice on them...

Click "View Blogs" if you would like to browse around, look at the blogs and perhaps leave a comment on one of them.

Click "Register" if you want to author a weblog of your own. Use your callsign as your "login" name.

Click the advertisement if you are interested in antennas, accessories, connectors and components. - Aren't we all, from time to time?

Click the Blogging FAQ to view an excfellent FAQ collection about blogging.

There's not much beef to see in there yet, as this is a new server. As more blogs appear there, it will become progressively beefier.

Mooooo!

Some of the anime newsgroups are frequented by young people. In general though, you have hit the nail on the head. Most younger people generally do not even know that usenet exists. They do just about everything on the web, where it's all colorfully "GUI".

Thanks for the "heads up", Bill. I had never heard of Firefox, but now have downloaded a copy to test and troubleshoot with. Maybe I can fix the problem with the page.

| Usenet is pretty much the domain of senior citizens.

Usenet is much less the domain of senior citizens than ham radio is.

Nowadays when somebody gets online, it's all about the web. Web web web. They think the Internet IS the web and vice versa. And this includes most senior citizens who get online.

Usenet is pretty much the domain of the computer saavy, those who have been online for years and years -- a group of people that excludes most (but not all) senior citzens and kids. Hams are generally more computer saavy than most, so I'd say that a higher percentage of hams are on Usenet than the percentage of non hams, but even so ...

That's not to say that new people aren't finding Usenet -- they are, but in small numbers compared to those that are finding things like web forums and blogs. (God, I hate that word `blog'.)

| Most young people think these types of postings are about as
| exciting as a glass of prune juice. Even if they heard of it, they
| wouldn't use a stick to touch it, and get Geezer juice on them...

Except that most senior citizens feel similarly about Usenet -- actually, many (most?) of them feel that way about computers in general. Most of the senior citizens that are online are mostly interested in email and clicking on web pages. The kids are similar, but they add chat, games and porn.

I'm 35. I've been on Usenet for well over a decade. I'm probably of an average age on Usenet, but definately younger than average for ham radio.

When I think about most senior citizens, I think of my grandma --
she's recently discovered AOL, and she likes email and likes the web,
and that's about all the Internet is to her. Usenet wouldn't interest
her at all. And my mom -- she's not even really interested in email
at all. And I imagine that both think I'm wierd for playing with
radios :)

Usenet is also suffering as a result of the belligerent, anonymous
neophytes. Take a look in alt.radio.amateur and all you see is porn spam.
Take a look at uk.radio.amateur and all you see is grown men arguing about
nothing. (Though usually to the detriment of M3's)
If anyone knows of an open discussion forum, anywhere on the 'net, that
doesn't degenerate in the same way, please point me in the right
direction.

Thanks,

73 - Steve

Wow! This is great news! Now I can sell my packet station
and read it online. Thanks!

I'm just kidding, of course, as I don't have a packet station since
1993, and when I did, I certainly didn't read bulletins, which were
mostly out of band mods.

There's no such thing as an "open" forum, and it not degenerating. If there
are any good forums, and I haven't found any concerning digital, they would
be highly moderated. But the problem with high moderation, is the delay and
lack of spontaneity. They become mere images of the moderator after awhile,
thus what you really want to find, is a group that has about 3 to 5 moderators.

First you have to find more than 10 people that are peers.

<< I have a friend who lives in Venezuela, and he would like to get a Ham radio liscense. >>

Get him to contact the following folks:

http://yv5fih.iespana.es/yv5fih/

http://www.modalnet.com/gmd/p1s.htm

they should be able to direct you to the right folks. If he's an american citizen, he may be able to work thru the ARRL and see if there is a reciprocal licensing agreement....I take it by your comments that he is a native of Venezuela, tho. Might be difficult with the current political situation in Venezuela, tho. Heh...I was there for the riots in '89....fun.

A

Hello!

Downloaded and tried it but can't get it to work.

I have two computers that are now connected line-out to line-in. I can
see the transmitted signals spectrum show up on the receiving end but
the receiver does not synch.

Any hints?

```

There is a new TNC from http://www.elcom.gr/index.htm
It has a USB interface and will work as a standalone DIGI without the USB.

Wondering if anyone has purchased one and how you like it.
Dave

Hi Steve,

Maybe you can help...
Myself and another ham are setting up a bbs here in Swansea, UK. WinFBB(16) with BPQ...

Any pointers ???

I have both software installed - latest Winfbb and BPQ 4.08b (with ll's) - onto a windows 95 osr2 box

I have bpqcode.exe running from the autoexec and winfbb runs fine.

However... I don't have a clue on the routes... ports.. virtual or otherwise!? The tnc is a tiny2 in kiss mode and can be accessed from windows using Hyperterminal.

But on sending beacons etc from bbs, nothing goes outward to tnc.. no lights.

Once it's working I'll also be needing to fwd and recv bulls and mail from an internet link to LinFBB...

Could you supply some well needed input ?
Maybe take a gander at the config ?

It's below:

```
BPQ
; For Version 4.08
;
;
; CONFIGURATION FILE FOR G8BPQ SWITCH SOFTWARE
;
; The program which converts this text file to binary
; form is currently very crude - be VERY careful when
; editing this file!
;
;
; The order of parameters in not important, but they
; all must be specified - there are no defaults
;
;
```

```
;
HOSTINTERRUPT=127 ; Sets the Interrupt used to access BPQ Host Mode. Will
    ; normally be 127, but may be changed if this clashes with
    ; other software. BTRIEVE seems to use 127, so if you are
    ; using it, try INTERRUPT=126

; Memory Usage. If EMS=1, the system will attempt to put its
; data area into EMS Memory. At the moment it makes no attempt
; to manage sharing of the EMS window, so you must not run any other
; software using EMS.
;
; Setting EMS=1 seems to cause problems with Desqview. I suggest it
; is only used with non-DV installations.
;
;
EMS=0    ; dont use EMS RAM
;
; I seem to have problems with systems not using DESQVIEW - especially
; NNA BBS's. The DV calls SHOULD be ignored if DV is not loaded, but
; just in case, if you set DESQVIEW=0, the 'Release Timeslice' call
; wont be used. MAKE SURE that you set DESQVIEW=1 if using DV, or
; performance will be seriously affected.
;
DESQVIEW=1
;
;
; Station Identification.
;
; If a user connects to the NODE Callsign or Alias, he is linked
; to the switch code, and can use normal NetRom/TheNet commands
;
; If he connects to the BBS Callsign or Alias he will be connected
; directly to a BBS port. If none are available, the connect will
; be rejected.
;
; Note that of you are running only a NODE (ie BBS=0), or
; or just a BBS (NODE=0), then you must still put in two pairs of calls,
; but they MUST be the SAME.
;
; If you are running both, the calls MUST be different

NODECALL=GB7TXS-9                ; NODE CALLSIGN
NODEALIAS=SWAN

BBSCALL=GB7TXS                 ; BBS CALLSIGN
BBSALIAS=BBS                 ; BBS ALIAS

;
; 'ID' MESSAGE - SENT EVERY IDINTERVAL MINS
;
```

```
; WILL BE ADDRESSED FROM THE PORT CALLSIGN (IF DEFINED)
;      ELSE FROM THE NODE CALL
;
; The following format allows KA nodes to include your system in
; their 'Nodes' lists.
;
IDMSG:
Network node (SWAN)
***
;
UNPROTO=MAIL   ; DEFAULT UNPROTO ADDR

; 'I' COMMAND TEXT
;
; Note that the bit about needing a port param in connects is only
; necessary if you are running more that one (radio) port.
;
INFOMSG:
GB7TXS Packet Switch, Swansea. IO81AP
Commands are basically the same as NET/ROM, but to connect to another
normal station (not another node), you must specify a port number before
the callsign. Use PORTS command to list available ports. The BBS command
connects you to the associated Mailbox.
***
;
; CTEXT - Normally will only be sent when someone connects to
; the NODE ALIAS at level 2. If FULL_CTEXT is set to 1, it
; will be sent to all connectees. Note that this could confuse BBS
; forwarding connect scripts.
;
CTEXT:
Welcome to GB7TXS's Packet Switch in Swansea
Type ? for list of available commands.
***

FULL_CTEXT=0   ; SEND CTEXT ONLY TO L2 CONNECTEES TO ALIAS

; Network System Parameters
;
OBSINIT=5   ; INITIAL OBSOLESCENCE VALUE
OBSMIN=4   ; MINIMUM TO BROADCAST
NODESINTERVAL=60  ; 'NODES' INTERVAL IN MINS
IDINTERVAL=15   ; 'ID' BROADCAST INTERVAL (UK Regs require
    ; an AX25 ID every 15 mins)
;
BTINTERVAL=0   ; NO BEACONS

L3TIMETOLIVE=25   ; MAX L3 HOPS
L4RETRIES=3   ; LEVEL 4 RETRY COUNT
;
; I have seen suggestions that L4TIMEOUT should be increased to very
; high values (even as long as seven mins). Although 60 may be a bit
;  short in some cases, I STRONGLY advise that you dont go much above
; 120 secs unless you understand ALL the implications.
;
; I've set TTL and TIMEOUT to the values agreed by the latest SYSOPS
; meeting - this does not imply that I agree with them!
;
L4TIMEOUT=120   ; LEVEL 4 TIMEOUT
L4DELAY=10   ; LEVEL 4 DELAYED ACK TIMER
L4WINDOW=4   ; DEFAULT LEVEL 4 WINDOW
;
MAXLINKS=30   ; MAX LEVEL 2 LINKS (UP,DOWN AND INTERNODE)
MAXNODES=120   ; MAX NODES IN SYSTEM
MAXROUTES=35   ; MAX ADJACENT NODES
MAXCIRCUITS=64   ; NUMBER OF L4 CIRCUITS
MINQUAL=10   ; MINIMUM QUALITY TO ADD TO NODES TABLE

BBSQUAL=30   ; BBS Quality relative to NODE - used to
    ; limit 'spread' of BBS through the network
    ; to your required service area. I've been
    ; asked to set a low default to encourage you
    ; to think about a suitable value. Max is 255

BUFFERS=255   ; PACKET BUFFERS - 255 MEANS ALLOCATE AS MANY
    ; AS POSSIBLE - NORMALLY ABOUT 130, DEPENDING
    ; ON OTHER TABLE SIZES
;
; TNC DEFAULT PARAMS
;
PACLEN=120   ; MAX PACKET SIZE
;
; PACLEN is a problem! The ideal size depends on the link(s) over
; which a packet will be sent. For a session involving another node,
; we have no idea what is at the far end. Ideally each node should have
; the capability to combine and then refragment messages to suit each
; link segment - maybe when there are more of my nodes about than 'real'
; ones, i'll do it. When the node is accessed directly, things are a
; bit easier, as we know at least something about the link. So, from
; Version 3.11 onwards, there are two PACLEN params, one here and
; one in the PORTS section. This one is used to set the initial value
; for sessions via other nodes, and for sessions initiated from here.
; The other is used for incoming direct (Level 2) sessions. In all cases
; the TNC PACLEN command can be used to override the defaults.
;
; The main reason for changing this now was a request from someone
; wanting to run an HF port.
;
;
;
TRANSDELAY=1   ; TRANSPARENT MODE SEND DELAY - 1 SEC
;
; Level 2 Parameters
;
; T1, T2 and N2 are now int the PORTS section
;
```

```
T3=180    ; LINK VALIDATION TIMER (3 MINS)

IDLETIME=900     ; IDLE LINK SHUTDOWN TIMER (15 MINS)
;
;
; Configuration Options
;
BBS=1    ; INCLUDE BBS SUPPORT
NODE=0                          ; INCLUDE SWITCH SUPPORT
;
HIDENODES=0   ; IF SET TO 1, NODES STARTING WITH # WILL
    ; ONLY BE DISPLAYED BY A NODES * COMMAND
;
; THE *** LINKED COMMAND IS INTENDED FOR USE BY GATEWAY SOFTWARE, AND
; CONCERN HAS BEEN EXPRESSED THAT IT COULD BE MISUSED. I RECOMMEND THAT
; IT IS DISABLED IF NOT NEEDED.
;
ENABLE_LINKED=N   ; CONTROLS PROCESSING OF *** LINKED COMMAND
    ; Y ALLOWS UNRESTRICTED USE
    ; A ALLOWS USE BY APPLICATION PROGRAM
    ; N (OR ANY OTHER VALUE) DISABLE
;
;
;
;
; 'COMBIOS' Port definitions.
;
; This section defines the virtual TNC's that the code supports.
;
; The basic format is:
;
;     TNCPORT
;  COM=n  ; COMBIOS port number
;  APPLMASK=nn ; Defaults to 1 (BBS)
;         APPLFLAGS=nn ; Defaults to 6
;      ENDPORT
;
; See APPLS.DOC for details on use of APPLFLAGS and APPLMASK
;
; Only TNC2 applications are supported through this interface.
; For information on using KISS or DEDHOST applications, see file
; DRIVERS.DOC
;
;   Dont try to define more than 16 ports.
;
TNCPORT
 COM=1
ENDPORT

;
; AX25 PORT DEFINITIONS
;
```

```
; These define the external links - normally to radios, but possibly
; to other computers, modems, etc.
;
; The hardware type and protocol are now defined separately, but
; at the moment only a limited number of combinations are possible
;
; Interrupt levels may be shared by any cards with suitable
; hardware. Examples are all but the earliest DRSI cards, and
; a MS400 modified as described by AA4RE in his MBBIOS documentation.
;
; There is a significant overhead in using the shared interrupt
; feature - try to use it on relatively low speed links, and
; wath out for TX underruns/RX overuns.
;
;
; See file PORTS.DOC for full details of available paramters.
;
;  Note that all timer values are in ms intervals. Most TNC's
; use different units for the various timers, so be careful!
;
; The timings are all derived from the PC's timer interrupt,
; who's frequency is about 18.2 HZ, so the resolution is only to
; approx 50ms.
;

Thanks for the reply Steve.

I've corrected the 9600 port speed. It was correct at 4800 but I reconfigured the tnc to 9600 now. bpqconfig file reflects this too.

I'm getting confused at all the "ports"...

Lets deal with BPQ seperate... as I think this is where the problem lies. It just can't seem to see the tnc.

Here is the relevant entry in the config file...

```
; The basic format is:
;
;     TNCPORT
;  COM=n  ; COMBIOS port number
;  APPLMASK=nn ; Defaults to 1 (BBS)
;         APPLFLAGS=nn ; Defaults to 6
;      ENDPORT
;
;
;   Dont try to define more than 16 ports.
;
TNCPORT
 COM=1
ENDPORT

;
; AX25 PORT DEFINITIONS
;
;

PORT
 ID=144.950 Mhz 1200 Baud
 TYPE=ASYNC
 PROTOCOL=KISS
 IOADDR=3F8H
 INTLEVEL=4
 SPEED=9600
 CHANNEL=A
 QUALITY=10
 MAXFRAME=2
 TXDELAY=500
 SLOTTIME=100
 PERSIST=64
 FULLDUP=0
 FRACK=7000
 RESPTIME=2000
 RETRIES=10
 PACLEN=120

ENDPORT
```

The TNC is on com1 3F8H irq 4 - standard settings.

The tnc works fine under windows hyperterm direct to com1.

I run BPQCODE from the autoexec before windows starts... all is ok...no errors..
Also a BPQ info message pops up before windows boot ... all seems normal.

Am I missing something here ?

Thanks,

Doz

Thanks for the reply Steve.

I've corrected the 9600 port speed. It was correct at 4800 but I reconfigured the tnc to 9600 now. bpqconfig file reflects this too.

I'm getting confused at all the "ports"...

Lets deal with BPQ seperate... as I think this is where the problem lies. It just can't seem to see the tnc.

Here is the relevant entry in the config file...

```
; The basic format is:
;
;     TNCPORT
;  COM=n  ; COMBIOS port number
;  APPLMASK=nn ; Defaults to 1 (BBS)
;         APPLFLAGS=nn ; Defaults to 6
;      ENDPORT
;
;
;   Dont try to define more than 16 ports.
;
TNCPORT
 COM=1
ENDPORT

;
; AX25 PORT DEFINITIONS
;
;

PORT
 ID=144.950 Mhz 1200 Baud
 TYPE=ASYNC
 PROTOCOL=KISS
 IOADDR=3F8H
 INTLEVEL=4
 SPEED=9600
 CHANNEL=A
 QUALITY=10
 MAXFRAME=2
 TXDELAY=500
 SLOTTIME=100
 PERSIST=64
 FULLDUP=0
 FRACK=7000
 RESPTIME=2000
 RETRIES=10
 PACLEN=120

ENDPORT
```

The TNC is on com1 3F8H irq 4 - standard settings.

The tnc works fine under windows hyperterm direct to com1.

I run BPQCODE from the autoexec before windows starts... all is ok...no
errors..
Also a BPQ info message pops up before windows boot ... all seems normal.

Am I missing something here ?

Thanks,

Doz

Hi all,

Does anyone have a wiring diagram for the 2.5mm PTT/Mic socket so I can use this handie talkie on packet ?

Regards,

Doz

Oh, you're talking about a Renegade motor home. Very funny. I thought you were talking about a Jeep Renegade. There is a huge difference, you know.

International Crystal should be able to make the crystals for you.

Likely using split frequencies for a digital repeater. We have 4 of them in the Pacfic Northwest, 3 operational on UHF, the one on VHF we lost the repeater council coordination so it is sitting idle.

Our repeater council expires corrdinations after 5 years, repeater on the air or not if not renewed for a fee.

Thanks Gary. I will contact JAN crystals and see if they know the type of crystals and
frequency needed for the TEKK KS-960 transceiver.

Yes, I suspect 433.100+ Mhz is for some sort of repeater. But I don't know whether it is still
around. I am still trying to find out whether there is any 70 cm packet activity left here
in Ottawa, Canada.

Since I have two of these TEKK radios. (I got two for the price of one). I may be the only one on 9600 baud packet. hi

If my suspicion is correct and there is no digital repeater on 433.100+ Mhz, I am probably better off getting crystals for simplex operation.

Do you know what are the more popular frequencies on 70 cm for simplex 9600 baud packet?

Rob

Sorry. Sounds cool.. Our EOC team (non ham) has several SSTV field setups..
works great..

No I am sorry I don't know of popular simplex 9600 frequencies. All of
my 9600 operation is through a digital repeater here. Make sure you
set the deviation for no more that 3 KHz.

We have a few ken-cams, laptops with MMSSTV, and I have a Tasco scan
converter with 5" lcd display. Works pretty well, we haven't had anything

photogenic since we put the system in place. :)

Even Wal Mart is selling them these days. Saw one model
for around $25. I did miss the original post in the thread though...

Has anyone on here tried to use win aprs with their PK900 If so what
settings did they use? I can't seem to figure out how to get my 900
set to the proper config wihtin Winaps   the only close TNC that i can
see on the list that AEA made was is the 232, which of course the 900
is not. -- Any thouths?

Thanks Zach

The PK900 should work great with WinAPRS. Just put it into the KISS mode.
If WinAPRS does not do it for you, then use a simple terminal program like

Windows HyperTerminal, and type the command "KISS ON". Then exit HyperTerminal and run WinAPRS.

If you want to continue using both ports at the same time, then you will need to put the PK900 into the XKISS mode. But I am not sure whether WinAPRS supports XKISS. (The command to put the PK-900 into extended KISS is "KISS $03")

In any event, when the PK900 is in the XKISS mode, you will not be able to use the HF port for RTTY, AMTOR, PACTOR etc. You will only be able to use the HF mode for packet...

By the way, WinAPRS is an old design 16 bit application. I prefer 32 bit applications like UI-VIEW or WinAPRS+SA. You may want to check those programs out. They all support TNC's with KISS mode.

Rob

Will the curect version of win aprs work well with the PK 900?
if so, I only seem to see subsets for genaric 2 port tnc's and 232s
will these work just as well, even though they were meant in mind for
that TNC and not necessarly the 900?

Thanks Zach

Has anyone got any experience with using any of the USB connected soundcards for digital modes.

I'm considering building a black-box for my portable operations containing a USB-hub, some USB to serial converters and a USB soundcard. This would reduce the number of loose cables by at least half in my setup. (who said this was a wireless hobby?)

I will be using the softwares WSJT, Logger32 and Spectogram but may in the future also be using mixw or others.

The USB serial cards are not so cheap that I can by a few just to test it.

Hello, i would like to better understand my Yaesu FT-100d CAT programming : where can i find detailed infos about it?

I would like to be able to change AIP and ATT, and all the other settings.
On rtx manual i haven't found all the infos i need.

Thanks,

Xref: g2news1.google.com rec.radio.amateur.digital.misc:142

Hi all--I am selling my Wavecom w41pc (not MKII) rtty decoder card package. It includes the ISA w41pc decoder card, Diskettes with v.4.4.0.0 software, a CD with the latest version 5.6, and the official Wavecom User's Manual in the original Wavecom binder. It also has the original factory checklist from Wavecom certifying that the card has passed all tests.

This is a VERY high-end and rare decoder (especially to find it in the US). It also costs approximately $4900 if you bought it from Wavecom. I am asking $1400 for the whole package shipped CONUS. Other locations need to inquire about shipping to your QTH.

While this is the original w41pc card, and not the current Mark II, Wavecom software works the same on both. The MkII added a descriminator output jack on the card and also shrunk the card a bit. Functionally the original and the MkII work the same (same modes, analysis, etc).

Please see the Wavecom website for further details.
http://www.wavecom.ch/products.htm .

By the way, Wavecom provides FREE web downloads of upgrades in its
software. Your decoder will stay current for a long time!

Please respond to me off list at wampus@nc.rr.com.

THanks
Chuck KI4BZJ

Hi Group,

Can a Kam Enhanced V8.0 do APRS? I know you can connect a GPS to it
but Kantronics history page says that only 8.2 does "Avanced Aprs". Do
you need 8.2 to run a program like WinAprs?

Thanks & 73

Anyone know where I can find a table of the modulation
modes, like what F3A and stuff is?

Actually, I'm looking for the designation that POCSAG
format would be. Besides saying it's just FSK(NRZ)

Mike

Can any one point me to a good expalnation of why PSK31 should be operated at low power ???

Have heard for a 100 Watt rig keep it throttled back to 35 Watts also heard 50 Watts.

I think it has to do distortion if higher power is used

But would like to see some detailed info on this

Post here as I must remain anon on the NG's

Thanks

PSK-31, more so than most modes, requires that amateurs respect each other's need to communicate. It is a very narrow band mode, and requires astonishingly low power to be effective. PSK is even more narrow banded than CW. The narrower the bandwidth, the less power you need to make it above the noise. Furthermore, on PSK, the DSP algorithms are good enough that you only need to be barely above the noise for 100% copy. Once you have achieved 100% copy there is nothing to gain by having a stronger signal.

Most amateurs use SSB rigs on PSK. Unlike CW, where a sharp filter can keep a strong station out of the passband (and out of the AGC), on PSK the entire PSK band is one SSB signal wide. If there is one strong station, that station is going to prevent everyone else on the band from hearing their own QSOs. Running 100 watts on PSK is the very definition of a LID.

> Have heard for a 100 Watt rig keep it throttled back to 35 Watts also
heard
> 50 Watts.

35 watts is probably tops for most conditions. A good operator will keep his power well below that, and only crank it up to 35 or so when conditions are truly horrid.

> I think it has to do distortion if higher power is used

Most SSB rigs can't deliver full power continuously. They are rated for peak power at a very low duty cycle. Many will toast their finals at 100 watts continuous. Depending on the rig and how you make the measurements, many cannot make more than half power without distortion, and distortion on PSK is a very bad thing. But this should be a moot point anyway. Most of the time you should be able to make the contact at a watt or so. Sometimes you may need to crank it up to 5 or 10, but if you need a lot more than that, something is very wrong. Most likely, some other LID on the band is running 100 watts.

Sadly, PSK seems to be experiencing the sort of power warfare that makes 20 phone such an awful place. A few years ago, it was rare to hear a station running more than 2 or 3 watts. Now it seems like 20 is a lot more common. Unfortunately, a lot of 20 watt stations means that other stations need to run higher power, too.

I am speaking here of 14 MHz and up. On the lower frequencies, especially

3.5 MHz, there is a need for a little more power. But at 14 MHz and up, the only reason to need more than about a watt is because QRM from stations running too much power are interfering with the receiving station.

My opinion only

- PSK has a pretty constant output that can exceed the duty cycle of a SSB transmitter. Hence reducing the drive to a lower output is kind of like the same average output on SSB

- PSK is also sensitive to non linearity and ALC/VOGAD/processors make a mess of it. The trick to setting it up is to supply a test tone and adjust the mic gain for zero indication on the ALC meter.

It is also worthwhile doing some linearity checks. ie using the PC sound card (PSK test signal) alter the output by -3 and -6dB. Check that there is a corresponding linear change in RF output power.

Cheers Bob VK2YQA

Here is an answer I received else where

Tis what I was looking for

Thanks to all who responded

When PSK31 is in idle mode, it is a two-tone signal having a peak to average power ratio of 2:1 or 3 db. So, if your average-reading meter shows 17 watts and YOU ARE NOT FLAT-TOPPING OR OTHERWISE DISTORTING THE SIGNAL, then your peak power or pep is 34 watts.

This should be well within the linear range of the Jupiter.

About the only way you can really be sure about what you are doing with PSK31 is to examine the r-f output envelope of the transmitter signal while in PSK31 idle mode. You should see the classic two-tone wave pattern that was in the ARRL Handbook for many years. The peaks should be clean and continuous, looking like sine waves without any flattened portions, etc.

The most power that you can run with any transmitter under these conditions is that power level which produces a clean two-tone output signal without distortion of the signal peaks. The numerical measure of this is the 3rd-order IMD distortion component. It should be at least 25 db below peak power and preferably more than 30 db below. Most modern rigs if not overdriven, etc. can produce -25 to -30 db IMD performance.

Most PSK31 operators find that average power levels in the 15 to 30 watt range - corresponding to pep levels of 30 to 60 watts - are more than adequate for PSK31 operation. Most transmitters tend to increase their intermodulation distortion product generation as power output goes up.

As in most of ham radio, there is nothing to be gained by running more power than it takes for the guy at the other end to copy you. With PSK31, you run the risk of a broad signal and interfering with others if you try to run more power than your equipment is capable of handling while still maintaining 3rd-order IMD performance of -25 db or better.

Any TNC can be used for APRS with a suitable program, e.g. WinAPRS. The
"APRS" features of TNCs relate to using them independently of any
external software.

All,
I am very new to BBSs and am trying to get F6FBB up and running with a
DSP232 in Host Mode. While the FBB700g docs state the BBS supports
the PK232, how different/similar are the PK232 and DSP232?

Does anyone out there have FBB running with a DSP232 in host (or any)
mode?

If yes, I would like to e-discuss further on the specifics... DSP232
setup, config files, etc.

Thx, Jim KN6PE

There is an F6FBB reflector running, though I don't know how much traffic
it carries these days, try sending 'SUBSCRIBE' to:
 fbb-list (at) phx-az.com

Sorry I had to despambot that address, but better that than fill the list
with ads.

I've only ever run FBB through BPQ software, using TNCs in KISS mode, so
sorry I can't be any more help.

I wonder if there's much reason to be interested in ultra-low-speed digital radio, by which I mean two or three bits per second, or even 1 bps, using spread spectrum modulation over a voice channel or across a whole band. The idea is to have a reasonably reliable HF communications channel for portable, low-powered equipment in remote areas. You'd use data compression so that a 100 character text message would compress down to maybe 40 bytes. At 2 bits/sec, sending the 40 bytes would take about 2.5 minutes, maybe a little longer if you add some FEC. 100 characters in 2.5 minutes is about 5 words per minute, a speed which has proven usable to novice ham CW operators for many decades.

The energy per symbol at 2 bps would be over 1000x higher than using voice, since packet operators routinely get 2400 bps through voice channels. So in terms of DX capability, using a 1 watt transmitter at 2 bps is like using a 1 kw transmitter for voice. Similarly, receiving data at 2 bps is like having 30 db of antenna gain over receiving voice.

I'm imagining an HT-sized tranceiver that you'd use with a collapsible vertical or wire antenna. You could be on some remote island or mountainside, crossing the Atlantic in a balloon or whatever, and still be able to send and receive text messages using a keypad and LCD display. Coverage would be equal to having a much larger transmitter and antenna at higher bit rates. You wouldn't necessarily have to be able to reach your destination, since any station that could hear you could forward your messages, either by digital radio or through the internet. You'd have a low-tech substitute for a satellite phone, that wouldn't let you have voice conversations, but that didn't depend on being able to launch stuff into space.

Of course, propagation permitting, your tranceiver could increase the bit rate up to near the chip rate (say 3 kbps for a voice-sized channel); or in really bad conditions, it could back off to 1 bps or even lower. I'm using the 2 bps example just to illustrate the kinds of applications I have in mind. I think most of the time, higher speeds should be possible. At low speeds, you'd have the usual spread spectrum advantages: low speed signals in the same bandspace shouldn't interfere with each other, since the spreading sequences would be uncorrelated.

I don't follow digital radio very closely but most new developments that I hear about aim at getting higher and higher bit rates to move more data, rather than lowering the bit rate to get better DX capabilities.

Thoughts?

Steve,
Thx for the reply; I'll check out the reflector.

For your BPQ config, what TNC are you using? Have you had it working with a KPC3 in KISS? That may be my next attempt if the DSP232 does not work.

Very interesting. Have you seen the extremely slow CW
program called "Argo"? Written by Italian hams and may
be of interest to you. I have it if you can't find it
(very unlikely.)

Seems to me I saw something on slow data a while back as well, but don't recall what or where.

Please post any follow-up info or results to the group.

Thanks.

Ok, I want to hook up my TS-430S to my computer so I can transmit in the digital modes. I've already received them by simply running the headphone jack into my computer's microphone jack and that works fine, but now that I'm KD5YRD/AE, I'm ready to try transmitting :)

I can certainly make a cable to hook up the speaker out to the appropriate two pins on the microphone jack -- that's not hard at all -- but what to do about the push to talk? What do most people do about that?

I could enable VOX on the rig.

I could make a switch I push whenever I'm transmitting.

I could make something and hook it to the serial or parallel port that
allows the computer to do it for me, but I don't know if any of the
programs support that.

I could make a circuit that closes the PTT switch if any signifigant
signal comes from the computer.

I'm guessing that most people just enable VOX, but of course that
won't work well on any mode where it has to switch on and off rapidly.
Or will it?

Thoughts?

Look at the back panel connectors -- one of these has a PTT line on it.

On my TS-570 I connect it to a footswitch
So should work for your application

That's pretty much what I was using, though I was on 5.14 and bpq 3.08 IIRC

Also had it working on a KAM using the same config.

On my TS680/TS711 I found that you have to ground two pins on the 15 pin ACC connector. One to mute the mic and the other to TX. The same connector supplies fixed level audio out and direct in. To make my TS680 match the TS711 I increased the internal voltage divider values on the inbound signal.

Depending on the software I use either a serial port RTS pin or parallel port DATA0 for this task. I just use two transistors as switches with suitable protection and "OR" gate etc diodes.

When I am playing wtth RDFT from a sound file player (Audacity) I use a manual switch that ties in with the same transistors. I have dreams of making a VOX like interface that looks at the data stream but havent got around to it yet.It would obviously need a fast rise and fall action.

To avoid noise paths I should have used optical coupling but havent! The VOX path should however solve this. (I have 2 audio transformers in place)

Cheers Bob VK2YQA

Steve, Thx for the reply.

I'm running out of options for the DSP-232. The overall documentation
sucks for me (the "new-bee")... however, I'm sure someone out there
has the answer, and I just have not found their site yet.

I spent the better part of this past week checking all different
combinations... comm port, baud/word-len/parity, port.sys settings,
TNC-init sequences, etc. Bottom line, not there and its not
intuitive.

Sorry for sounding impatient with this stream... I'm trying to help
the Santa Clara County (CA) Dept of Health Services get a BBS up and
running for their packet Hospital Net. KPC-3s + KISS + BPQ are the
next target. Beyond that, if you (or anyone) has the equivalent of a
"BBS-in-a-box" (read: cook-book approach for getting a BBS up and
running with HW people have readily available), I'm listening.

Thx for your help and hanging in there with me.

A lot of folks use interfaces like the Rigblaster series from West Mountain Radio: www.westmountainradio.com.

You can also look at the SignaLink from Tigertronics: www.tigertronics.com.

These interfaces provide for VOX/PTT control and hook-ups between radio and computer. These interfaces make the process easy and safe since they provide for isolation between the computer and radio. The various models can be very simple or loaded with many features - more I/O, dual RS-232 ports, etc. There are plenty of existing circuits around to build your own.

They can be used for PSK31, Echolink/EchoStation, Hamscope, etc.

Cheaper versions are at www.packetradio.com.

Good luck - Joe, N2QOJ

No I haven't seen it, but I don't think you can really use CW for this
to full effectiveness even if you've got a 1 hz analog bandpass
filter, because it's hard to decorrelate a signal that slow with all
kinds of intereference. I'd have thought you'd need spread spectrum.
But I'm really not up on this kind of thing.

"Hank Oredson" <horedson@att.net> writes:
> http://pulsar.princeton.edu/~joe/K1JT/

Thanks, that's quite interesting, even though the description is very incomplete. I wish there was more technical documentation there.

I know that a possibly-similar multi-tone FSK scheme was suggested by Phil Karn KA9Q some years back, though I don't know whether he ever implemented it. The goal was to be able to write the modem in software on a PC and connect to a radio's audio channel using a sound card. He wanted to operate at RTTY speeds (50 bps?) while I'm thinking in terms of going much slower.

I'm pretty much a newbie to this stuff but I have the impression that if you can escape that audio constraint (i.e. if you can directly digitize your receiver's mixer output and use software along the lines of GNU Radio for demodulation instead of messing with sound cards), it's better to use wideband direct sequence SS to minimize interference potential.

While I have yet to see APRS used in an emergency, I'm not ready to write it off.

Packet, however, is another matter. Here we have used packet in anger, and in many situations it is vital. It doesn't hurt that we have perhaps a dozen packet stations scattered around the county in county facilities. For damage reports and the like, packet works a lot better than voice.

It's not only when the "official" communications are down. Governments are under cost pressure just like everyone else, and in many places the 911 crew is a bunch of minimum wage college kids. When things get interesting emergency managers would prefer to rely on trained communicators.

> The reason Amatuer Radio is useful is that hams can move
> equipment to where it is needed, operate that equipment,
> and provide VOICE communications when the emergency
> services VOICE links are not working, during the first
> phase of an emergency.

VHF phone undoubtedly does all of the heavy lifting in an emergency. However, in many states (mine included), the state EOC and Red Cross aren't reachable by VHF. We have had many situations where we have needed to resort to CW to get through. We are working on building out the packet network so that won't be necessary in the future, but right now, CW is an essential, if small, part of the mix.

> to send documents and spread sheets. The packet
> network can do this quite well, once the radios are
> returned to the packet sites and put back on air.

We cannot effectively respond to an emergency without planning and preparation. Part of that prep, of course, is being able to quickly go anywhere and set up communications. But part is also having the right equipment in place at the right place. We find it important to have a significant number of phone and packet stations collecting dust waiting for the event.

> What I suggest is that you don't ask the question here,
> but ask the emergency services people in your area.
> Talk to the local sheriff, the fire marshal, the local
> hospital emergency coordinator. Find out what has
> happened in previous emergencies and how Amateur
> Radio might help solve their problems.

Most counties have an emergency manager who understands the needs of all of the agencies. Your EC should be talking to this guy frequently. And an effective EC will be using ARES/RACES members to develop responses to some of those problems.

> I've never had one of these people say that they
> needed help finding out where their vehicles are
> located ... other than by VOICE.

Bah...

Most ppl just seem to have some sort of mental block that prevents them from seeing where APRS might actually be useful.

Setting up portable weather stations in the vicinity of a forest fire is very useful.

Coordinating DF operations through APRS is a thing of beauty.

In a large scale disaster, I would say that having APRS trackers on the buses (or whatever) used to transport large numbers of casualties would be *very* handy.

With APRS, like any other similar technology, you have to understand how to exploit its usefulness in order to get it beyond the "gadget" stage.

The beauty about APRS is it's automatic. It doesn't need to take a piss break every couple of hours. It frees up operators to do other VOICE related activities. Which is better from a resources standpoint -- having 5 operators with HTs and Kestrels manually reporting weather on a periodic basis (rotating shifts, etc, etc) -- or 5 autonomous weather stations reporting the weather on a continuous basis -- and being able to read the information directly from a map of the area?

I think saying that packet is not of interest is a VERY broad and bold statement that is untrue. Here in our county (Hutchinson) the head over all county emergency managment loves packet. being a ham he knows the vales of ever aspect of ham radio.. but packet is the only form of communications that when typed in one one end comes out exactly the same way on the other.. you can have a hard copy on paper and there is no confusion.. I agree that 2m/70cm is going to handle about 90% of the communications in a desaster but it's nice to have MANY options packet or not. Alot of the guys (me included) run HF mobile so we have the ability for long range communications no matter where we are.. just because it's not used as the primary source of communications doesn't mean it's bad..
APRS shined bright one year when we had a tornado that hit a town and there where someplaces out in the country that were almost impossible to find because signs and everything else were gone.. well if a APRS station did make his way to a certain place it was real easy for someone to look on a computer screen and see exactly where he was so others could get to him..

Perhaps. Let's be honest; ham radio spectrum benefits fewer than 500,000 active hams at any given time (my estimate and probably wildly optimistic). Unlicensed 2.4GHz users alone (meaning cordless phones and 802.11) are probably 50x that at any given instant.

I'm not suggesting that we should just give up ham radio spectrum, but I am objectively observing that we're getting far, far more value than we seem to recognize. It's like having half of the national forests set aside for the use of less than 1% of the population.

The key words are "most", "should", and "effective" ;-)
It is not happening here. In fact the last SET was canceled
due to lack of participation.

One thought:

One reason that we do the "public service" activities, such as supporting large scale public events like the Boston Marathon, various charitable walks/runs/rides/paddles etc, is to practice radio handling and procedures in emergency and improvised conditions.

In our area, APRS was used last fall as an experiment with the Head-of-the-Charles crew race. Part of our support for this event is placing hams in 6 rescue boats up and down the river. APRS was used so that Network Control could dispatch the closest rescue boat to a racer in the water. Not perfect, but it did show some of the issues with using APRS, and the next time will be smoother.

I would suggest trying out APRS for similar things in your area, and get some real world experience before deciding whether it would help in your situation.

Most of the usefullness would be not for each unit to know where it is, but for a central planning person to know where resources are located.

Happy trails,
Gary (net.yogi.bear)

HT works better.
It's two way, fast, and can be used for other things.

5 operators with HTs.
They can do other things when position reports are not needed.

You dropped the pertinent part of what I wrote.
"AT THE START" of an emergency.

Also note that I did not say it, the folks involved in actual
emergencies OBSERVED that packet was not of interest
until the initial S & R and situation evaluation were finished.

Those APRS radios usually work just fine on voice. You WILL
be told to use them that way, and use them that way PRONTO.

It very much depends on HOW you deploy APRS.

As a Group, we have set up a number of tracking kits that can be thrown into a vehicle and on air in 2 minutes. We do not rely on personal equipment to do this.

The HUGE advantage of APRS, in my experience, is a 95% reduction in the "where are you" radio traffic. This in turn releases valuable voice net time for passing messages.

Giving the emergency services a view on exactly where their vehicles are, with 100% confidence, makes this a very useful tool in our armoury of solutions we can provide.

> That's my "position" on APRS, folks... It's a fine example of wasted
> motion. - A distraction from the job of providing meaningful, useful
> emergency communications.

Not a distraction, an extra that can be rolled out IF the circumstances warrant a solution of that sort.

Just as conventional packet has a place in transferring evacuation centre information etc., but not if the emergency means you are manning loads of vehicles.

You apply each of the tools you have, as appropriate to the emergency.

Jim

Some months back I was interviewing a group of fire chiefs preparing for a
project, and they did request the ability to relay temperature and humidity
back from the scene.  However, the equipment needs to be placed somehow,
most likely by a human responder, and he is probably going to know where he
put it.  So it's not clear to me what advantage APRS offers in this
situation.

> So it's not clear to me what advantage APRS offers in this
> situation.

APRS has built-in facilities for reporting weather... automatically... continuously... without operator intervention.

APRS is *not* just about position reporting, it's much richer than that.

This is a right tool for the job situation. Voice HT is the right tool for many jobs, maybe even most jobs -- but not every job. There *are* situations where APRS can be very useful. I've heard far too many people chewing up bandwidth while studdering and stammering trying to figure out where they are so they can give a position report when APRS can do it with a 2 second data burst on frequency other than the primary [emergency] communication channel. And the positions are overlayed directly onto a map to boot.

It *can* be a timesaver, resource saver, and bandwidth saver.

On the other hand, I realize there are people (like Hank) that simply "don't get it" and "don't want to get it". So be it.

Ha,we use aprs in our local storm spotting and we just got the layover
worked out to layover APRS date directly over the radar map and the local
emergency manager said "you'd better hope I like you, I can lead you
directly into the path of a tornado" with much laughing of course.. :)

In 1968, I restored a white '61 Oldsmobile Starfire convertable. When I was finished, it had a white leather interior and enough exterior chome to help a blind man see. It was absolutely gorgeous and won several California car show awards. Later, I bought a '69 Dodge Challenger (446ci engine). That car, while fun to drive, certainly drank more gas then my present SUV. I loved the muscle car period, but it will likely never happen again.

Of course. A vehicle isn't large enough unless you can eat dinner in it, preferably while driving. ;-)

> (snip)   No military but I've driven all
> sorts of vans, large cars, etc. They don't
> bother me at all but the SO needs to
> have a small vehicle because the big

I've drove all types of vehicles, from an MGB convertible to muscle cars to motorcycles to large commercial trucks, and have so far been lucky enough to never have an accident while driving. One of my vehicles was hit hard while parked, another ran over by a passing tractor plow, and two damaged by vandalism. But no moving accidents. My wife, on the other hand, has had three accidents. Luckily all relatively minor - no injuries.

Where are you? We've been using it here in Indiana for several years now,
along with SSTV.

Here I am...

The no-license MURS service allows 2W transmitter power, gain
antennas, and voice/data.

The no-license MURS service allows 2W transmitter power, gain
antennas, and voice/data.

Some work has been done on generating a new protocol standard,
optimized for today's applications over medium speed (1200-19.2Kbps)

I oversee an ARES group.
We would like to provide digital still photos back to the Emergency Management Offices from disaster sites.
What type of gear would I need to do this ?
How long does it take to transfer a photo ?

Thanks,
Steve

To be honest, I've never gone to Dayton, so I'm speaking more generally. I've found that when you take a successful homegrown event like this and try to 'improve' it, oftentimes the charm is reduced. Pacificon has apparently grown to nearly-national level stature, and moving from the Bay Area would likely make it something else entirely.

Just a thought too :-)

73
Dana

They had to have some parts added to them because in crash tests, they
were running right over the cars thay were colliding with, crusing them,
and almost certainly would have obliterated any occupants inside.

Here is a quote from the latest National Geographic oil article about *why* a lot of women drive the monsters. This from a woman that owns an H1 Hummer: I know it's not fuel efficient, but I love knowing that anything I bump into, I win."

I hope she never does anyone harm with that Hummer, imagine the fun the legal beagles will have with that little comment!

Simple misplaced caffeine driven family protectionism, coupled with a complete lack of respect for the other person gets us to where we are now.

I predict that soon we will be seeing women driving modified Kenworths and Macks. An enterprising person could outfit a sleeper cab into a massive van! That'll teach those people in those puny Hummers and Excursions!

Well, enough reminiscing. We're _way_ off topic in every newsgroup we're posting to. If you want to take it to private email, please feel free to do so. Take care, Jim.

To be fair to my wife, I should mention none were directly her fault. Of course, she didn't have the skill to drive her way out of these situations, but she was the one hit in each case. With the exception of one (the one I described), she should have been able to avoid the accidents. Again, take care.

Towing a trailer with a Renegade? The man must have been mad. I have a hard enough time controlling my Explorer with a trailer and it is considerably longer than a Renegade.

I don't doubt it. As much damage as that Ford Expedition did to my wife's car at only about 20-25 mph, I'd hate to think what would have happened at faster speeds. However, the high repair bill was mainly because she hit the right front fender and tire at an sharp angle, damaging the body, steering, and front wheel drive.

> Here is a quote from the latest National

That attitude it not that uncommon among those driving larger vehicles. And, as long as they drive safely, I don't see anything particularily wrong with it. The danger lies in the neglectful attitudes that can easily follow.

> I predict that soon we will be seeing women
> driving modified Kenworths and Macks. An

> people in those puny Hummers and
> Excursions!

Not that far out. I had a friend years ago who spent almost two years rebuilding a military armored personnel carrier (APC) to drive on the highway. He replaced the tracks with tires and added bumpers, lights, turn signals, horn, steering wheel, modified exhaust system, and so on, just to get it to comply with local vehicle laws. Even after all that, they still wouldn't allow him to license it. Since this guy was a maniac behind the wheel, I'm kind of glad he never did get that thing on the road.

Are you posting from alt.ham-radio.vhf-uhf, Mike? If so, lets kill the other crossposted newsgroups in any future messages.

He's on his second Renegade, the first wasn't quite big enough. It was
the one with the slideout kitchen area. The new one has the full slideout.
It's BIG!

Then the trailer... He usually has 1 or 2 race cars in the trailer.
Sometimes 3, then a small 'pit car' like a PT Cruiser. And a
golf cart or two...

I found out, well, he found out, California has a 76 foot limit...

Want the real kick? It doesn't require a CDL. As long as it's
registered as a 'camper' and 'not for hire'.

We send photos across our network now and again.
Also drawings, power point presentations, spread sheets,
software, whatever.

Network is 9600 baud, about three dozen nodes.
Takes anything from a minute to several hours.
Depends on the size of the photo file.
If you really need high resolution 1.5 MB JPEG that takes awhile ;-)
Usual case is in the several minutes range.

We use various windows applications.
You could just as well use Linux or MAC, all work fine.

Email is simplest since the recipient can
do whatever they want with the attachment, and
the email can explain why the picture was sent,
when and where it was taken, etc..

Use whatever packet system/protocol you have. The time taken to send a binary file such as a jpg photo is simply a function of the speed of the network and the size of the file. There is no "magic" to it at all. You might want to take a look at Slow Scan TV. It is potentially faster than packet but does require some specialized equipment.

All it takes these days is a laptop with a soundcard and a cable with a couple of resistors in it. Not all that specialized. Well, OK, if you want to do it right you need another cable with a transistor and a resistor. If you would prefer a pretty box to something homebrew you could go out and buy a RigBlaster or something along those lines. Works just as well on VHF as HF. There are plenty of RigBlaster clones out there, and some of them cost less than you pay for the box.

I tend to wince a little at getting a commercial interface because I'm inclined to prefer melting solder, and it's terribly simple. But these interfaces are awfully cheap, and having it all in a neat little box is probably worth it.

Most of the common software includes the wiring diagrams in the help files, and they pretty much all show the same circuit. The only thing the least little bit tricky, and the commercial boxes won't help you with this, is setting the input level. You need resistors or a pot between the laptop and the mike input of your radio. The level needed varies A LOT from rig to rig, and you need to get the level down to where the rig won't distort the audio. This will take some tinkering. With FM, a deviation meter might be handy to do this, but you can probably get close by having someone listen to your audio. A lot of repeaters will report your deviation given some touch tone beeps. Don't be thinking more audio is better - it's decidedly worse. This is probably even more true on FM than on SSB. All you need is enough to be clear on the other end.

Take a peek at MMSSTV, which is probably the most popular SSTV program and it's free. MixW is another popular one ... it's shareware, and it's not as good for SSTV as MMSSTV, but it does about every mode known to man, so it does give you a chance to experiment a bit. I think you can use it for some period of time before it starts nagging you to pay, so you can get a feel for whether it's worth it.

We use APRS to track the tail end of a fun run / race / bike ride. We then know where the end is. Then as the this progresses we know how long till the end passes the checkpoints. Then the RAYNET stations know how long they have left to be on duty.

Looking to buy used a small TNC, to connect a small notebook PC and a Yaesu VX-5R. Everything (1 kg notebook, its 12v power adapter, TNC, X-5R with its 12vDC power adapter) must fit in my briefcase with room to spare.

You kind on-topic assistance is appreciated.

As much as I'd like to sell you my old TNC220....

A few thoughts;

- Wondering why you specifically want a TNC..
- If the PC has a sound interface consider using a "soundmodem" driver.
ie drive the radio from the speaker and listen on the line input. (with
suitable isolation and level control.
- Use the parallel or serial port to drive a Baycom style modem. ie a
single chip and XTAL from memory. (eg
http://www.qsl.net/iz7ath/web/03_digital/02_modem/english/pag01_eng.htm)

Then again you have probably heard all these arguments before!

Cheers Bob VK2YQA

Take a look at the KPC3 from Kantronics. It has the capability to run from
a PP3 9V battery (internal!) it's small and lightweight.

There's one on Ebay,

http://cgi.ebay.com/ws/eBayISAPI.dll?ViewItem&item=5700825487

I have one, and I can recommend them.

```

I recently obtained a TEKK KS-960 Transceiver for 70 cm 9600 baud packet. I need to change the crystals so that it will operate on a different frequency. It doesn't look like TEKK is still making these radios.

Even though the radio came with the service manual, I do not see any specs on the crystals.

Does anyone know the type of crystals involved for the TEKK KS-960 radio and how I can calculate the frequency for the XMIT and RCVE crystals?

Around here folks are using 433.100+. I do not know why there are using a split frequency. You can have different XMIT and RCVE frequencies in the KS-960 but it is not designed for full duplex.

Don't get the KPC-3!   It is TOO big and bulky. (I have one. It is too big to be used with a handheld radio for portable use).

Personally, I would NOT buy a North American TNC from Kantronics, AEA/Timewave or MFJ. All these TNC's have their own proprietary host mode (used to communicate with a specially designed computer program running on your PC). There are very few FREE programs out there that support these proprietary host modes. (And in my view, none are very good). As a result, these companies all try to nail you with expensive terminal PC software. The TNC option will start to get very expensive.

(One way to get around this expense is to put the TNC into KISS mode and use one of the free KISS mode terminal programs. There are a couple out there. Or use the TNC in KISS mode with the AGW packet engine which will then act as an interface to many great FREE WA8DED terminal based programs).

To make matters worse, these North American companies mentioned above have done next to nothing to update the firmware in the TNC's to support the new emerging needs of Hams. (e.g. None of these TNC's support Smart Beaconing for APRS, etc).

I hate to say it but it would appear that the only true innovation in packet TNC technology lately is coming out of Europe where packet radio is still very popular. (see www.symek.com)

Instead, I would buy a good European TNC. Almost all the European TNC's support the WA8DED hostmode. There are lots and lots of GREAT FREE terminal programs that you can download off the net that support this industry standard. (e.g. Do a Google on "Paxon").

Here is a great SMALL 1200 baud TNC from Europe. It is called the USB micro TNC. And it is not that expensive. See http://www.elcom.gr/sv2agw/tnc.htm It is a fraction of the size of the KPC-3. It also uses a USB interface which makes it ideal for use with a laptop. It is also powered by the USB interface. No need to install a battery like you would need to do with a KPC-3.

If you are looking for another USB based TNC, see www.baycom.org. They have one that supports both 1200 baud and 9600 baud. But it is the size of the KPC-3. It is about the same price as the USB-micro-TNC.

If you really want to support a North American TNC company, then I would recommend that you buy MFJ. (I thought I would never say that!) They make a good TNC2 clone. If you do that, I would recommend that you replace the firmware with The Firmware (TF) v 2.7b which supports the WA8DED hostmode. This firmware is FREE but you will have to find someone to burn you a WA8DED host mode chip for you.

Alternatively, you can easily build a very small KISS based TNC. As noted above, there are a couple of very good KISS terminal programs that will run under MS Windows. (see WinTNC). Or you can use the AGW packet engine to act as an interface between the KISS modem and many great free WA8DED based terminal programs out there.

Here is the link to building a low cost KISS based TNC, called the TNC-X -- http://www.john.hansen.net/PICTNC.htm

And finally, as noted by another poster, you can consider whether you really want a TNC after all. You can easily use your sound card in the laptop as your packet modem. The interface is very easy. You can build it yourself for $10 to $20 US or buy an expensive rig blaster interface. The FREE AGW packet engine or the Flexnet32 software is all you need to make it work.

The advantage of the soundcard is that is will also let you use other modes other than packet. e.g. SSTV, etc.

The disadvantage is that is ties up the sound card. (You can't easily add a second one to a laptop).

So if you want to play NHL 2004 and have the packet gear hooked up and running at the same time, then forget the sound card approach.

For more info on sound card packet see www.qsl.net/soundcardpacket

I hope you find this post helpful.

Damn.  I was hoping you were closer.
Used SSTV a little today, when the weather blew through.
KC6ETE here, you know where to find me.

A soundcard interface needs no power supply and can be quite small if you
homebrew it to your own specifications.
Schematics can be found all over i-net.

>What do you definitely need?
>A logging program or a packet program?

Both, and with the limited memory capabilities (over 64MB on this machine
actually slows it down, because of the BIOS), finding a pair which were not
memory hogs, or a dual-function program, would be very nice.

>I have some www adresses for free (FOR AMATEUR USE ONLY) programs.

That would be very nice. I'd appreciate it if you would send them to K7AAY
at the appropriate ARRL forwarding e-mail address (not explicitly listed,
to reduce the spam inevitiable if one posts a complete e-mail address on
USENET).

>But I doubt this would be for amateur radio use...

Why? Didn't I specify this was for the Co. ARES unit?

>Nevermind we all are happy CBers now!

The meaning of your last sentence eludes me.

>Look for the Winlog32 full (registered) version which has maps You can
>easily find it witha good search engine.

We are building out the packet net, and doing so with donated equipment.
We are searching for more RAM for the laptop, and perhaps you overlooked
the statement in the original posting, e.g.:
>>will be scrounging for memory for this Armada 1590

The EOC packet stations are being fully funded by the appropriate agencies,
but getting full funding for firehouses and field stations is more
difficult. Voluntarism with in-kind donations from civic-minded
corporations is allowing us to stretch our capabilities.

Perhaps you could sppecify the Utopia in which you reside, which provides
full funding for all ARES needs?

Ah. I thought not.

<plonk>

>Shiiiiitttttt

Thank you for noting your primary output.

Is there anyone else who can stay on-topic in this NG?

Did you actually read the original post you arse ???

How do you propose that he does that ? Go to the website and read about
it yourself.

Nobody is trying to steal anything. There doesn't seem to be a way to buy it. The following is the message that is on the web site

A Message from the Family of Konrad Byers

I am very sorry to inform you that Konrad Byers (VE1EXE) the developer of "DSP and More" software and the eSoftAnywhere LLC and web site, is dead at the age of 34. He was vacationing in Berlin, Germany, when he experienced chest pain and difficulty breathing and died shortly thereafter in an ambulance on September 13th, 2003.

I am Konrad's father and I have been getting email addressed to him at eSoftAnywhere; he (very fortunately) left me his computer password before he went away. Unfortunately, the completion and distribution of Konrad's DSP software is well beyond my capabilities. I am also a ham radio operator (VE1AMU) and I did do some operational testing of his program for him at various stages of development but I have no knowledge of this level of programming. Sadly, I have to recognize that all of the work he did on this project, especially the upgrades he worked on so intently during his last month, was in vain and the many people who downloaded his 30 day trial beta version will now only have an expired copy. He was a very talented Clarion programmer and it is highly unlikely that I can find anyone with the required skills and interests who could take over and complete his work. I would like at least to be able to release an unprotected copy of the beta version someday but I am not yet in a position to say if that will be possible.

The management of this web site is also something I am unable to undertake although one of Konrad's colleagues has posted this note for me and has offered to keep the site going for the present.

In his on-line FAQs my son said he would be giving a "lifetime guarantee" of on-line upgrades to people who purchased his program. Little did he know how short his guarantee would be.

I hope you will understand.
Ron Byers

The present eSoftAnywhere email address will be discontinued but I will, for some time at least, continue to get Konrad's email if it is addressed to VE1EXE@rac.ca .

My name is Randy Long, a friend of Konrad's who worked with him on his last contract in Connecticut. Ron asked me to post this message, and to look into removing the 30 day trial restriction and distributing the DSP software as freeware. I will have to identify the last stable version, and re-make it enabling the registration feature. The DSP software is a combination of Clarion, C++ and C. Supporting this software beyond my expertise and interest. I will, however look into setting up a newsgroup and setting up an open source organization.

I'm not certain, maybe just a coincidence, but there's a Tom Gibson I know/met who's has some ties to Montana. He may have worked up there for some time. This fellow was also a maritime operator and is currently (I hope!) an officer on the museum ship John Brown (Liberty Ship in Baltimore). Last time I saw Tom was aboard last year. Might this be the same person?

  Hi Gary,

    I can't help you yet, but in the meantime, please don't use
all capital letters. It is considered to be shouting.

    Thanks and 73s.

        Jack W8RAG

Yes. This time it's a Socialist, last time it was a raghead... You can always count on some kind of big-time loser to try to get up on a soapbox and spout off their load of junior high-school level propaganda. They all have a line of "shinola" to push.

(Yawn)

Charles, N5PVL

> Google for "hipcrime".
>

Hipcrime (as a term) was coined in the late 1960's by the sci-fi writer John Brunner, in his novel "Stand on Zanzibar". Brunner raised a number of sociological issues in "Stand on Zanzibar" that were considered to be really "out there" at the time of publication, but that turned out to be everyday stuff by the time the 1990's rolled around. He did a better job than many have done at peering into the future, and deserves credit for that.

Somebody thought the "Hipcrime vocabulary" in Brunner's novel was neat, and decided to steal the name and concept to describe their own actions. They missed out on the most interesting idea in the novel though... A running, mythical sociological text entitled "You Are an Ignorant Idiot", that was put forward in the novel by means that are commonly described as "the blogosphere" today. Brunner never got credit for foreseeing the blogosphere but if you read his novel, it is there in plain sight for all to see. Only the name "blog" is missing.

Yup. Perhaps the author of the original hipcrime software
was a Brunner fan :-)

That book is kicking around here somewhere, in a box probably.
Something like 35 boxes of books that have not gotten unpacked
since our move in '97, most piled in the library, but others scattered
here and there. Most of the sci-fi is still lurking in the boxes.

The newsgroup attacks have somewhat abated now ... but every
now and then a few turn up. I've gotten a few via email as well.

Not sure if this will help, but check the settings of your sound card on
your computer. Make sure that if you are using Line Audio Out on the
sound card that it is checked. (turned on.) Also, if you have one of
those "surround-sound" cards, make sure that the line audio port is
actually used as a separate audio feed, and not intended to be the
"rear" speakers.

I am using the Rascal with my IC-740, and had a similar problem. Mine
turned out to be the surround-sound issue.

Good Luck and 73!

Funny you should ask! I exchanged e-mail with John Hansen W2FS, the author of the RadioMirror multicast software on this subject about a week ago. I was asking for a critique on an idea I had to put RadioMirror on a soundcard, while optimising it for HF use at the same time. John said that he has moved on to hardware projects and does not program as much as he used to. He gave me his blessing to modify or even re-write RadioMirror, and offered access to his source code.

USPN http://www.uspacket.net recently advertised on E-Ham.Com in the digital forum for a Windows psk programmer. The theory here is to use multiple psk streams, each time-staggered so that the seperate multicast streams provide fills for each other's data blocks much faster than having to wait for the entire file queue to go around, as we do now with a single data stream. The multiple streams will also increase overall throughput, as the system will be decoding files from several data blocks at once... Cute, huh? At this point we are thinking of maybe four or five streams, making the signal about the same overall width as HF Packet. One idea we are kicking around is an extra psk stream that makes it possible to QSO with the operator of the RadioMirror server, while it is transmitting data.

As we know from playing with Q15x25 mode, we can go up to 15 psk streams if we want to. - I think that four or five would do just fine though for HF, and it most definately will be less controversial. Four of five streams gives us the same bandwidth as a traditional HF Packet signal.

Here's why I am looking at psk streams:

* PSK software exists that decodes up to ten streams at once, so we know that we can do multiple streams. Actually, Q15x25 decodes 15 psk streams at once.

* PSK works well with low power on HF, something to consider for a multicast transmitter which is on the air full-time. The PSK streams will give better range and coverage on HF than packet could ever hope to provide. - Especially at the reduced power that goes along with continuous-duty transmission.

* PSK is in the soundcard domain... DLL's exist that make it easy to write psk programs, so much of the work is already done.. - You just inject your multicast data into the streams instead of input from the keyboard. Having the client programs run from a soundcard will go far in making RadioMirror usable by a larger number of hams.

* PSK can run full-time. RadioMirror must go in fits and starts (1kb packets) simply because it uses KISS mode and the Packet protocol. There will be no need for a psk version to ever go off the air, even for a second. This should make it much easier on the transmitter, and will give you a cleaner signal with less fluctuation. A clean signal is a big deal on something like this.

So I am sorry to say that no soundcard alternative exists right now, but if we can find the right Windows psk programmer, there is a chance at having a soundcard version that will be usable on all ham bands, including HF.

I think we can reasonably assume that a multi-psk version of RadioMirror on HF will move data much faster than anything available today, including wide modes like PACTOR III, CLOVER, and Q15x25 mode. - And it will do it the same chunk of spectrum a single Packet QSO takes up. The fact that not one, but an unlimited number of receiving stations will be able to simultaneously decode a multicast transmission will revolutionize HF digital communications. - No joke!

In the mean-time, you might ask the authors of MIXW, the fine multimode soundcard program if they would consider supporting RadioMirror client. Those folks are pretty good about that kind of thing.

Has anyone connected a Yaesu FT-7100 to a Baycom modem?
I tried to connect it through the packet port, but it didn't seem
to work. A friend told me that I may need to connect the modem
through the mic and speaker connectors instead of the packet port because the
modulation of the audio through the packet connector is different from what
the modem expects.

Any help will be appreciated!

thx,
Andreas

Gary are you related to Bill Turner by chance ?
Yep all capital letters is considered yelling and quite rude.

Thanks for your response :)
I strongly believe and support this idea. And if we can have total
control on that streams (how many will broadcast and how many
will communicate)(like the channels option in packet) then i think
this new program can hope in a better tomorrow.
A new receiving and cheap device with some memory can also be born
just a radio with a decoder soft , a lcd screen and an ip address or
call sign for keeping someone update in news or anything ,text
messages(sms), only text e-mail especially in places without mobile
services or on the move.And all these services No money.
Or maybe very very cheap in a amateur club level.
We need imagination here.

Ian,

This is a KISS OFF procedure I have used for years when my PK-232 gets its brains scrambled and you need to get back to the command mode.

Good Luck

Dick, AA5VU

```

Ian,

All you should need to get out of kiss mode is a method to send 3 or four
Ctrl-C chars to the tnc. I believe you can do that with a terminal program
like procomm or with winpack or similar packet terminal program.

tim ab0wr

> PK232 out of KISS mode?
>

Ian,

I have a copy of the setkiss.exe program..

```
C:\>setkiss ?

Usage: SETKISS comport baudrate type_tnc

   comport     baudrate         type tnc

   1 = 3F8h    1 = 1200    A = AEA (pk232 pk88)
   2 = 2F8h    2 = 2400    O = Kantronics 2.XX
   3 = 3E8h    4 = 4800    K = Kantronics 3.XX
   4 = 2E8h    9 = 9600    T = TNC's with TAPR eproms.
               0 = 19200   H = TNC's with TF or WA8DED eproms.
               3 = 38400   M = MFJ Hostmode eprom.
                           N = Resets KISS to normal.
```

```
Ex: SETKISS 3 0 H = Sets kiss in a TF connected at COM3 at 19200 baud.
    SETKISS 1 4 N = Resets kiss on COM1 at 4800 baud.

(c) pa3fua. Jan-1993

C:\>
```
is that the one you want ? I use it on my KAM and it works fine.

you can find it at:

http://rook.ath.cx/setkiss.exe

I just set-up two batch files, kisson.bat and kissoff.bat
Depending on which paket app I am running.
for kiss apps,

```
KISSON
APP.EXE
KIISOFF
```

for normal AX25 operation,

```
KISSOFF
APP2.EXE
```

I like to leave the TNC in non-kiss mode if I'm leaving it connected to a
radio for the HEARD function.

HTH,

 - Steve

[snip]

Actually, the PK-232 is easier to get out of KISS mode than most TNCs.
You can do it by sending -

1. The normal exit KISS sequence - character codes 192, 255, 192.

2. Three Ctrl+C characters in quick succession.

'2' can easily be done from most terminal programs.

if it's a TNC, the hardware chip handles it. If it is a soundcard application,
then of course the driver software handles it. In KISS you just get
processed octets, and you don't have to work at the bit level.

Ever Wondered What Happens When the Cameras
are not On During Survivor or Temptations Island ?

Curious About What Happens Behind Closeed Doors
On Big Brother or American Idol?

You Know Crazy, Wild and even Obscene things Happen!

The Networks Dont Want you to See This!!!!

BUT WE SHOW IT TO YOU!!!

http://tinyurl.com/2xcy2

BECAUSE THE CAMERA WERE ROLLING the Shots just got
BANNED or CENCORED but we Have the SECRETS from REALITY TV

This is for real You Know You Want to See It!

More Erotic Than Temptation Island
Beyong BigBrother
Sexior than Survivor
Better than the Bachelor
Raunchier than The Amazing Race

EXHIBITION   VOYEUR
Nasty Obscene, erotic, dirty, insestuous, gross, indecent,
sleezy, impure, wild, erotic, pornographic, smutty,
risque, sensual, sexy.........
YOU NAME IT - THEY DID IT
ADD WE HAVE THE PROOF

The Contestants Did it all and the NetWorks Couldnt
Show it, it was Banned, Cencored there Secret
Now we show you what they were doing!!!!

Fetishes, Lingere, Lesbianism, Bi Sexual Experiments,
Foot Fetishes, FORCED SEX, Cross Dressing, Swinging,
jacuzzi group sex, threesomes, hi heels, rubber,
Whatever turns you on - they did it while they
thought no one was watching.

The Real Private Secrets from, Survivor, Bachelor,
Bachelorette, Temptation Island, Mole, Joe Millionare

Contestants caught naked, stripping, playing, sucking,
fucking

Did you know some contestants were lesbians some were
sluts, On one show a chick gave everyone a blowjob
including the camera MEN!!!!

Behind Closed doors, in changing rooms, dressing rooms,
in the bushes, private sets, closets, showers, lakes,
all sorts of places they thought the cameras were not
around, BUT THEY WERE and WE GOT THE SHOTS!!!!!

All the things that got Cut out, the
camera men saved them after the Network
cut them and banned them.

You Wont See this ON Jerry Springer!!!!!!!!

You Think Girls Gone Wild was HOT This is like
The Sexual Olympics, but only for Real

The Cameras Caught them - The Networks CUt them
WE HAVE THEM

Quick Before they get Cencored or Banned Here!!!

OutFuck - OutSuck
Who Will be the Last One Hard

Spam from VoteNader.org? (Or naderexplore04.org)

You may have received spam email recently that appears to come from our campaign, or be about our campaign -- perhaps the "From" and or "Reply-to" addresses look like they are coming from VoteNader.org. Or perhaps you have received a message that appears to come from an individual (if the address is real, the real owner probably did not send this email either) with suppressed recipients. Or maybe you received an email that appeared to come from yourself promoting our site.

These messages are NOT from Nader for President 2004, and these email tactics are NOT condoned by our campaign in any way.

UPDATE: Some of the latest forged emails have been made to appear to be coming from naderexplore04.org. Again, we are not responsible for this unfortunate abuse of email, and there is little in the technical sense that we can do to prevent this as it has nothing to do with our actual infrastructure. We are collecting information.

NOTE: The emails with malicious code (viruses, worms, etc.) often have attachments. Our campaign will NEVER send attachments in our announcement emails to you. Please be sure that you have anti-virus software and have the latest updates available for your anti-virus software.

Our hosting service has alerted us to say that Nader for President 2004 appears to be the target of what is called a "Joe Job." Such an event is where a spammer forges email to make it appear to have come from some other domain (such as ours -- or yourself). This is hard to prevent on our end and part of the insecure nature of the email protocol in general.

Members of our actual email list must request to receive email from us (either through Ralph's signup sheets or subscribing during our exploratory phase, or now on our campaign site). When one signs up for email they must reply to a confirmation message before they receive our list announcements.

Our public announcement emails come from "campaign@votenader.org," contain a "Paid for by Nader for President 2004" statement at the bottom, and have "updates@lists.votenader.org" in the "To:" header. Unfortunately, some of these indicators can be forged as well.

Most of the Spam that we have received complaints about appear to be forged from email addresses not associated with votenader.org (often forged to appear to be coming from government email addresses), and have our website code embedded in the body of the email with hidden tags that contain random words that work to subvert anti-spam software.

If you are on our lists, you can ALWAYS unsubscribe at ANY time by following the instructions included at the end of our announcements. You can also use our unsubscribe page using the email address you signed up with.

If you are receiving this SPAM, we extend our apologies.

We will pursue the spammers to the full extent of the law.

For more information, please review these resources:

How Do I Determine the Source of an Email?

--

what really was going on as he was telling me things indirectly. So he left again, the next week he brought me a drink, after drinking whatever it was I started feeling strange pain in right side of my brain. And my brain started melting, I got this flu and somehow my brain cell and nerves started coming out through my nose, He kept bringing these drink everyday sometime he will pour them in different glasses, by saying okay one has death for you, other one has poison to effect your brain and this one has poison to effect you digestion system etc. I though he was joking. It is said that he did not kill me because he did not have enough courage to do so. That was the time when for days I would have nothing to eat sometime, and I used to walk from station to home in rain all alone and no one ever bothered to ask how I was feeling.

It is clear from this attack that these people actually can?t kill you as they are coward they can only make your life difficult by trying biological weapons on you. To kill someone you need a lot of energy, this is a Psychological war on Islam, you don?t obey them you will be tortured abused and raped mentally, physically and psychologically. But that is the best they can do. This is not true that these things were mistake everyone knew that I was real real baby. Many Muslims knew what was going on (more detail in other mails) but they were scared to help as they did not want to be the next target. One must question how do these Jewish Muslims get to join secret services, how can they get access to very dangerous biological weapons.

You Jewish Muslims are your own enemy you get used by Israel as tools and then you get rejected by Muslims too. I honestly don?t know how these people can be so inhuman as I did not even know what as going on in this world at that time. People must learn to be open and learn to discuss what happens to them. I ho

I am running a F6FBB 7.00i BBS with BPQ node switch software. The PC has a full time internet connection and users can TELNET into the BBS without any hassles. The question of internet email came up a few months ago and I thought it would be easy to figure out a way to forward a PACKET email to an internet email address.

Well, it's not that easy. I have tried several things but nothing seems to work. FBB doesn't forward internet email address's to the TCPIP/TELNET port without make a connection to another BBS first.

Has anyone ever set up a email gateway using FBB software? Please give me your ideas.

73,
Rob N4RPD

That's a good point. BBS message forwarding over Internet links is comparable to making a "DX" contact over the EchoLink system.

(Yawn)   - Pretty boring!   Zero accomplishment factor.   No challenge. Undercuts hams trying to do the same thing with radio.

Besides being about as exciting as watching paint dry, BBS message forwarding over non-ham links causes serious problems for BBS SYSOPs who actually DO use radio to forward messages, the way the system is intended to be operated. These hams who use radio have priority over hams who do not, in all of our considerations. To enjoy this status, all we have to do is to cooperate with our fellow hams and use radio for this task. The BBS forwarding network is a cooperative activity. If you cannot or do not consider your fellow hams, you will not be either happy or effective as a BBS SYSOP, and should not interfere with the activities of those who can and do.

Since our affiliation with the Department of Homeland Security last year, systems such as the HF BBS forwarding nets that can be used for some types of emergency and disaster communications have been given some additional regulatory status, and additional priority when being considered in connection with grant proposals. One additional change over the last year is the total loss of any sense of humor when cases of interference with emergency communications systems come to light.

Operating a packet BBS is a serious task that requires a good deal of dedication to and cooperation with your fellow hams, and especially with your fellow SYSOPs. Injecting non-ham links into an amateur radio network without consulting anybody as to its desireability reflects niether of these good characteristics.

Even when they function well, (they often do not) the non-ham forwarding links directly undercut the BBS forwarding network's special ability to provide alternative, independent communications during the course of an emergency. Because of the damage "internet forwarders" do to the HF net's integrity, many BBS SYSOPs simply refuse to accept or deliver messages from the "non-ham" BBS stations such as you propose. That tends to add to the boredom factor.

The general class liscense exam is not substantially different from or more difficult than the technician test. You do have to copy 5 wpm code, something most hams are able to cram for within two or three weeks. Used tube-type HF rigs suitable for most digital stuff are available online and elsewhere for a couple hundred bucks or less, and a simple, inexpensive inverted-V antenna will get you on the air with no tuner. Once other hams find out what you are trying to do, many of them will be motivated to help you out. - The point being that there is literally no excuse for injecting non-ham links into an amateur radio network where they do not belong, and where they are detrimental to our ability to provide emergency digital communications.

Over the last few years, the great majority of the "non-ham" packet BBS stations have shut down. Only a stubborn few remain.

Catch the wave!   (RF)

Too funny, like 190 lines is going to bring down the Internet in a
newsgroup. The Internet police really give me a chuckle. Thanks for the
laugh Mike.

Thanks for all the replys, good and bad. I should have said up front that I
intended only to provide a service for HAM's to send outgoing packet email

to internet email addresses' and NOT vice versa. I don't advocate non-ham traffic on BBS's and do not host those type's of forums on my BBS, other SysOps do and it is their decision to do so, but I choose not to for many of the same reasons stated in the replys.

73,
Rob N4RPD

Ever Wondered What Happens When the Cameras
are not On During Survivor or Temptations Island ?

Curious About What Happens Behind Closeed Doors
On Big Brother or American Idol?

You Know Crazy, Wild and even Obscene things Happen!

The Networks Dont Want you to See This!!!!
        BUT WE SHOW IT TO YOU!!!

http://aufqz.url.cjb.net

BECAUSE THE CAMERA WERE ROLLING the Shots just got

BANNED or CENCORED but we Have the SECRETS from REALITY TV

This is for real You Know You Want to See It!

More Erotic Than Temptation Island
Beyong BigBrother
Sexior than Survivor
Better than the Bachelor
Raunchier than The Amazing Race

EXHIBITION   VOYEUR

Nasty Obscene, erotic, dirty, insestuous, gross, indecent,
sleezy, impure, wild, erotic, pornographic, smutty,
risque, sensual, sexy.........
YOU NAME IT - THEY DID IT
ADD WE HAVE THE PROOF

http://tinyurl.com/2jysv

The Contestants Did it all and the NetWorks Couldnt
Show it, it was Banned, Cencored there Secret
Now we show you what they were doing!!!!

Fetishes, Lingere, Lesbianism, Bi Sexual Experiments,
Foot Fetishes, FORCED SEX, Cross Dressing, Swinging,
jacuzzi group sex, threesomes, hi heels, rubber,
Whatever turns you on - they did it while they
thought no one was watching.

The Real Private Secrets from, Survivor, Bachelor,
Bachelorette, Temptation Island, Mole, Joe Millionare

Contestants caught naked, stripping, playing, sucking,
fucking

Did you know some contestants were lesbians some were
sluts, On one show a chick gave everyone a blowjob
including the camera MEN!!!!
-
Behind Closed doors, in changing rooms, dressing rooms,
in the bushes, private sets, closets, showers, lakes,
all sorts of places they thought the cameras were not
around, BUT THEY WERE and WE GOT THE SHOTS!!!!!

All the things that got Cut out, the
camera men saved them after the Network
cut them and banned them.

You Wont See this ON Jerry Springer!!!!!!!!

You Think Girls Gone Wild was HOT This is like
The Sexual Olympics, but only for Real

The Cameras Caught them - The Networks CUt them
WE HAVE THEM

Quick Before they get Cencored or Banned Here!!!

OutFuck - OutSuck
Who Will be the Last One Hard

All the things that got Cut out, the
camera men saved them after the Network
cut them and banned them.

Anybody still using this mode? I would like to set up a sked with someone
to FINALLY make a G-TOR qsl (prefer North America for reliability). Any
takers? I live in Edmonton, AB and can work 10, 15, 20 & 40m.
Thanks.

We have been down this road before.

U.S. troops sent to war half a world away. American foreign policy controlled by an arrogant elite, bent on projecting military power around the globe. A public misled into supporting an unconstitutional war founded on deceit and fabrications.

As the death toll mounts, we hear claims that the war is nearly won, that victory is just around the corner. But victory never arrives.

As the public loses confidence in the government, the government questions the patriotism of any who express doubt about the war.

When a presidential election arrives, both the Democrat and Republican nominees embrace the policy of continued war.

The military draft comes to dominate the lives of America's young, and vast numbers who believe the war to be a senseless blunder are faced with fighting a war they do not believe in, or facing exile or prison.

The year was 1968. Because voters had no choice that November, the Vietnam War continued for another six years. Hundreds of thousands of

Americans like you died, were maimed, or suffered from diseases like malaria. A far greater number of Vietnamese died.

Today, the war is in the quicksands and alleys of Iraq. Once again, under the pressure of a determined resistance, we see an American war policy being slowly torn apart at the seams, while the candidates urge us to "stay the course" in this tragic misadventure. Today's Presidential candidates are not Nixon and Humphrey, they are now Bush and Kerry.

Once again, there is one overriding truth: If war is the only choice in this election, then war we will have.

Today enlistments in the Reserves and National Guard are declining. The Pentagon is quietly recruiting new members to fill local draft boards, as the machinery for drafting a new generation of young Americans is being quietly put into place.

Young Americans need to know that a train is coming, and it could run over their generation in the same way that the Vietnam War devastated the lives of those who came of age in the sixties.

I am running for President, and have been against this war from the beginning. We must not waste lives in order to control and waste more oil. Stand with us and we may yet salvage your future and Americas' future from this looming disaster.

Sincerely,
Ralph Nader

by the Maoists and those of the Shining Path of Peru.. Maoist violence has already cost Nepal several hundred lives and destruction of property worth millions of rupees. In 1996, the year the insurgency commenced, 82 people were killed. This figure included insurgents, security forces, personnel and civilians. During the next year, total killings came down by half - 38 people died. The following year, in 1998, after the Maoists intensified their program of violence, 408 people were killed - nearly an elevenfold increase in the number of deaths over the previous year. Ever since, the death toll has been on the rise. By late 2000 the death toll has risen to over 2,100. As of August 2002, nearly 5,000 lives have been lost to the insurgency "

Shining Path sent congratulations to RIM for its first anniversary in May of 1985. The Central Committee wrote, "...the people's war in our country continues to blaze defiantly, expanding, spreading its roots and preparing for newer and higher tasks, guided always by Marxism-Leninism-Maoism, battling for the emancipation of our people for the purpose of and at the service of the world revolution. Thus we are contributing and will contribute to the tasks of the RIM, more and more willing and able to aid in every possible way our glorious common cause: the emancipation of the proletariat and communism prevailing though out the earth.

"Comrades, the Communist Party of Peru is part of the Revolutionary Internationalist Movement and feels honored to be so, honored to serve in such a far-reaching and historic vanguard battle, as well as to have the comrades in arms found in our Movement's ranks; and furthermore, the Party feels fortified and augmented by the repeated expressions of support, o

Hi,

I'd like to join the APRS network via my T-Mobile cell phone which
offers unlimited "internet access". I put Internet in quotes because
only certain ports are allowed out. Port 80 is one of those ports.

Is there anyway that I can report and receive APRS data via the
Internet using Port 80 instead of the standard 10xxx port (I forget
the exact number)?

Thanks,
John

Yes, so is it: as many digis know each others due to the auto router, you can just type for example "hb9eas-8 db0frg" in the connection window of Paxon to access a BBS via your digi. These paths are kept in memory, and your call-ssid as well so you can choose them for each connection.

An other problem with AGWPE is that it keeps the default SSID for every connection until you change it manually and with twice the same SSID on one digi, you'll have problems, so you must enter a different SSID manually each time you make a connect.

I don't know why these problems occur with Paxon... It should be a bug as 2.00.1114 is the first version running with AGWPE and is a beta-test version.
Other programs I tested didn't have these problems Winpack, Winstop, WPP...

I think the best way of using Paxon is to run it with Flex32. Just have a look at uspacket.net.

> NODE2, from that node, then you simply use the command   C NODE2

These are NET/ROM nodes I'm talking about. I am able to send the command C NODE2 and it connects but any other input from me never gets sent. If I use a via path to connect (C NODE2 v NODE1) to a node it works fine. Connects and input gets sent ok. I like the way Paxon lets you set the colors of the headers/input text/output text/etc so you are able to see whats going on much easier. I started out using GP/TFPCX and have been looking for a windoze "equivalent" ever since :)

I am using a ic706 in vox mode for psk31.. and it appears that the vox
doesn't like psk

from what i can tell.. there are only certain frequency ranges that the vox
will keep keyed steadly in..   It makes it difficult to use in vox mode,
unless i remember where i can and can't transmit without making the relay
click on and off..

anyone else experience this ? or have any ideas

Using VOX while in digital mode must be very crude!
Especially with PSK and other sound card stuff.

In article <3f310dde.0405041238.32dba1a1@posting.google.com>,
Ian <ian.bari@att.net> wrote:

> To make a long story short, version 2.0 also calls out for a 136 bit minimum. And I'm still not 100% sure why.

I can only speculate about the motivation of the authors of the AX.25 specification, but it seems very reasonable to _not_ consider flags to be part of the frame.

First, an AX.25 frame is likely to be (or, more accurately, will always be) preceded by many flag characters. These multiple flags are sent to permit the transmitter adequate time to come up to full or nearly full power. Many amateur transceivers have a long receive/transmit turnaround time. This time is particularly long on many synthesized transceivers, where (as I understand it) the frequency of the synthesized oscillator must be changed as the rig changes from receive to transmit. An artificial delay is introduced prior to transmitting to permit the oscillator to stabilize. Of course, if you have a rig with a very short receive/transmit time (typically a crystal-controlled transmitter), you will still need to send enough flags to permit the receiver to potentially change from transmit to receive. Even if your transmitter and receiver could get by with only one flag, it is entirely possible that your TNC (however it is implemented) will not be able to sync on a frame with only a single flag.

Second, in wired, full duplex environments, where X.25 (from which AX.25 was pretty directly derived) was normally used, the transmitter would normally send flags continuously when no frames were being transmitted. This permitted the receiver to know that the transmitter was still alive and to maintain bit synchronization in anticipation of receiving a frame. Note that the X.25 link-level protocol is referred to as an bit-oriented protocol, and is related to other (a descendent of other) bit-oriented protocols such as HDLC (ISO), SDLC (IBM) and ADCCP (ANSI). I don't have the specs in front of me, but I seem to recall that at least some of the standards refer to flags as "inter-frame fill characters". Obviously, because AX.25 is a half-duplex protocol, the inter-frame fill character concept was not copied from the X.25 specification.

Third, many of the bit-oriented protocol specifications permitted two frames to be separated by a single flag.

(You will have to check the spec to see if this is permitted in AX.25.) As an aside. one of the very early, and fairly popular HDLC chips required two flags, rather than one, between frames. There was actually talk about changing the HDLC spec to conform to the operation of this chip, but fortunately this didn't happen.

So, reasonable sounding conclusions include:

- because flags provide byte synchronization, rather than any useful information, they ought not be counted in the length of the frame
- because many flags are transmitted prior to the frame, it is easier to not count any of them, rather than just one mandatory flag
- because a single flag could (in theory, in some bit-oriented protocols) be both the initial and the terminal flag of two adjacent frames, it is easier to not count flags, than to try to take this special case into account.

An interesting exercise would be to see with the X.25 specs say about the minimum frame length and whether flags are counted. Without looking, I am pretty sure that the X.25 specs did not count flags when calculating the minimum frame size, for the reasons listed above.

Of course, while I can make these arguments sound pretty reasonable, I have no idea what the people compiling the AX.25 spec were _really_ thinking.

More trivial from,

Yes, but they _specifically_ include the flags in the
minimum of 136 bits in all versions of the spec I've
seen, starting with 2.0.

> Third, many of the bit-oriented protocol specifications
> permitted two frames to be separated by a single flag.
> (You will have to check the spec to see if this is
> permitted in AX.25.)

It *is* permitted, and I started to write a note suggesting
that this could be construed to reduce the total frame size
to 136 bits, except... the closing flag of one frame is the
opening flag of another, and therefore counts as 8 bits for
both frames. So I decided not to mention it.

Deep down, I keep thinking that the 136 number is chosen
because it's *certain* to be too small for any valid frame,
though it's still 16 bits too short to contain the minimum
valid frame.

Perhaps Jon Bloom is lurking, I'm pretty sure he's been
around the AX.25 spec since the primordial days.

If a UART is used, it takes care of flags, FCS, and bit stuffing.

So unless you write your own bit-banger HDLC, you will
never actually see the flags and FCS, and the remaining
octets of the frame will all be 8 bits long as expected.

My guess is that the specs assumed a UART implementation,
but the illustrations show the frames as sent ... minus any bit stuffing.

I don't seem to have any documents earlier than V2.0 (October
1984) in electronic form. Certainly if I dig through file cabinets
and boxes of old packet docs the earlier stuff is lurking around
here somewhere ;-) They don't seem to be in the folders labeled
"packet docs" nor in the folders "net docs". There is a file drawer
of stuff back to 1983 in the other room, but I'm not going to dig
through it all to see where that "136" came from ;-)

Terry Fox would have the answer though ...

But the minimum length really is not an important thing to
think about for any reasonable implementation. When you
decode the frame ... you won't find what you expect to find
... and will drop the frame, or send RNR or do something
appropriate.

... and will not add up to 136 bits either; only 120 bits
if you omit the FCS and the bounding flags.

> My guess is that the specs assumed a UART implementation,
> but the illustrations show the frames as sent ... minus any bit stuffing.

The bit stuffing is apparently considered transparent
at the MAC layer.  Even though the FCS is usually calculated
and appended automatically by the serial controller, it's
not MAC layer.

Yes, seems like the confusion is about exactly what part
of the protocol is at the MAC layer, and what part is not ;-)

Really not all that bad. You do need to fiddle with the antivox and vox gain a bit on the 706, but once set it seems to wotk fine. But, it only takes a single transistor to key the thing from the serial port, so that works a bunch better.

Thanks for the bringing WPP to my attention. I downloaded it. But I can't
seem to find any English docs.. Any there any English docs? Or will I have
to learn German?

Hello group,

Could anybody give me any links about studies done about the feasibility of using APRS in a real emergency situation?

- what use has APRS in emergency situations?
- are direct packet links preferable to APRS (1200 baud AFSK)?
- are other digimodes (MFSK-16, PSK-31, RTTY) preferable to APRS?

Any help is useful, thank you!

the only adjustment i can find on the thing is the min gain and the vox
delay.  do you know how to get to these other settings ?

at my emergency operations center we use aprs..
the county has a setup and each of the municipalities (towns)
have a setup.. we are on our own little uhf frequency and we are not
bogged down by 5 million stations trying to tx at the same time..

APRS is nice .. it's nice to look at a map - click on a municipality eoc
and type a message.. but it has it's drawbacks too...
try to type more than 3 or 4 lines and it will truncate your message..
try to print the screen and the software crashes..
messages have no formal formatting... just text typed on the screen...
(which it's supposed to do)
you have to close the log file ,in aprs , in order to print it...
the maps are nice .. if you are going to track a mobile user it
may be suitable..
if you are going to send short messages back and forth .. it's great..
but if you are going to send more than a few lines.. be prepared to
type multiple messages..

nice program but aprs wasn't designed for emergency communications...

as far as the other digimodes... except basic packet, i dont have
experience using them so i can't say...
why not test it with a friend.. and see if you like it.. if it
fits your needs..
who knows.. maybe they fixed a few things since i last seen it..

we did use a packet system once.. the problem with a direct packet link
is when sending a message you would have to connect to the packet system
you were sending the message to and then type your message then disconnect
from the system.. while you were connected to the destination computer no
one else could connect .. if you have someone that doesnt type fast and has
a lot to type.. it could hold up someone trying to send an urgent message..
thats why we switched to aprs.. so no one would tie up the computers...
(remain connected to) with aprs there is no connecting to the destination
computer.. it just sends the message..
aprs also has a acknowledgement feature.. when a message is received by the
destination computer it sends an 'ack' and lets you know the destination
computer received the message... (doesnt mean it was read by anyone
though... just means it was received by the software..)

well i hope this wasnt too much rambling on....

try Babelfish <http://world.altavista.com/> for starters. It or
similar online translators may be of some use. It may also make for
entertaining translations which will still be usable. I notice it
allows a small amount of text input or a pointer to a web page. Try it
on a few web pages, then, if it looks workable, you could probably put
the docs up to a web page of your own long enough to evaluate the
translation.

I'm not aware of a specific study, but here is a link to a United States Navy web site focusing on APRS. Perhaps they, or one of the links there, can provide what you're looking for.

http://web.usna.navy.mil/~bruninga/aprs.html

Well my Mother nearly ran off with a yank during the war so I feel I was
cheated......I love all things American up 'till it all went wrong about
'73.....

Good God man is there anything you don't know !...well the MOT was up on
friday last...I have the shoes,the fitting kit and two new wheel cyl's just
can't be bothered fitting them....just have to use the Merc and the Muzzy
'till I can........James Muir Sewart.(GM4DHJ)

What? You didn't get a picture of those Antenna girls inside the loop
area wearing the corset top and the mini skirt?!?!  Nice pictures
otherwise, thanks!!

Dana,

No...it wouldn't be!...but maybe it would raise the "standard" of our
beloved Hobby's National Convention. Should't we hold our premier Convention
in a venue more fitting....??

Aren't we tired of Hara...and the rain...and the lousy accomodations....and
long lines for the Johns....etc...

Just a thought!....

73....

That's about right. I left in 1978 and didn't return until about 1989. It was a major culture shock. Been thinking about leaving again ever since.

> Good God man is there anything you
> don't know !

It's not hard to find anything written on the internet or in the newsgroups.

I just don't have the patience to work on vehicles anymore. My SUV needs some very minor work, but it will wait until the next service. However, in your case, one would think you would be in a little bit more of a rush to fix that Fiat since you have to drive around in a Mercedes 'till then. ;-)

But, of course, you do also have the Muzzy. I had a Kawasaki year ago, but traded it in for a BMW R100 RT while living in Germany (needed something larger than a 650 to tote the wife around and really liked that particular BWM). I later sold it to a friend who decided to drive on the wrong side of the road during a vacation to London. He survived, the BMW didn't.

Please note that APRS is an Automatic Position Reporting System first. It is great for knowing WHERE people are without having to. The Wx, message and DF capability are nice, but quite secondary. Think of it as a logistics aid with minor message capability. For traffic (message) handling during emergencies, any of the keyboard-to-keyboard modes should be better as could voice be.

     I got some pictures of people taking pictures OF them. Does that count?

     I heard that you could get your picture taken with them foe 10 dollars.

;-)

Well yesterday morning after parking in the Staff car park I came down about 10am to go out to a job to find a big black line down the side of the Merc , the drivers door pushed in and the door mirror hinge broken...sitting beside it was a big dirty Land Rover discovery with marks on the front rubber corner bumper. Well ,I found out who it belonged to from the car park guy and SHE was summoned. "Sorry I didn't know I had done that" SHE said (True! or SHE would have ran the scene)..... �600 worth of damage BIG FAT STUPID WOMEN SHOULD NOT BE ALLOWED TO DRIVE ANYTHING BIGGER THAN A MICRO CAR...THERE SHOULD BE A LAW AGAINST WOMEN DRIVING 4 BY 4'S SUV'S MPV'S THEY JUST DONT HAVE THE GRASP FOR ANYTHING BIGGER THAN A PRAM!!!

>
> But, of course, you do also have the Muzzy. I had a Kawasaki year ago,
but

I recently got two older Icom IC-2N HTs (2 meter) for use in decoding
APRS packet radio. Nice radios, but I get less than 10% of packets
decoded with either radio. Compared to 100% of packets using my Yaesu
VX-2R. I know the problem is not the decoder, but the radio audio,
and wondered if there is anything I can do to improve the Icoms.

(And, no, I do not have an oscilloscope.)

Mike

The first and simplest things I'd suggest are:

- Make sure that you've turned the HT's power-saving receiver mode off! A lot of HTs save battery power by spending most of their time with the receiver "asleep", turning the receiver on several times per second, and checking for the presence of carrier. This will play merry hob with packet reception, as you'll almost always lose most of the packet-synchronization preamble.

- Turn the HT's volume level down fairly low. You want to make sure that the analog signal coming out of the HT isn't clipping (overdriving the HT's audio output circuitry) and isn't overdriving the TNC's input circuit. It's usually a good deal easier for a TNC (hard or soft) to track a low-level audio signal, than it is for it to track an overdriven high-amplitude signal full of distortion and intermodulation.

If neither of these helps, then I'd suspect that there's some nasty noise or distortion, or excessive receive equalization occurring in the HT's audio circuitry, and that some substantial circuit mods might be required. These would probably require a schematic, 'scope, and some audio analysis tools such as an audio spectrum analyzer to figure out properly.

Ouch! A lot of people shouldn't be driving SUV's. About seven months ago, my wife's little car was hit by a big Ford Expedition at a stop light. Even though the lady driver was only going about 20 mph, with hardly a scratch on that truck, it darn near killed my wife's little car (almost $1800 in damage). It was at night and the lady driving the Expedition claimed she didn't even see my wife's car sitting at the intersection (too busy looking the other way to turn left I guess - or either blind as a bat).

Funny you should say that. It is exactly the reason my wife drives a small car. She just cannot handle a larger vehicle. It scares her. She almost completely panics when she sit behind the steering wheel of a big vehicle. In my case, I learned how to drive large trucks in the military year ago. After leaving the military, I drove trucks for while and and managed a commercial truck rental company. Therefore, driving a larger vehicle is nothing to me.

Of course, the so-called "gas crisis" in the '70's certainly pushed many into smaller vehicles. But this is a big country. People drive an average of 20 miles to get to work each day, with more miles for lunch and shopping after work. Add in a load of kids, the pet, and the shopping, and it's obviously uncomfortable to drive a smaller vehicle. That is pushing people back to larger vehicles. In my own case, I use my truck to tow large boats, both for pleasure and for Coast Guard related activities. Since this is important to me, I tolerate (but obviously don't enjoy) the higher gas prices.

Yes, I've noticed that about APRS... Once you've set it up, you can watch the little icons, all stacked on top of each other. Every once in a while, one of them shifts position, goes off the "air" (actually Internet) or suddenly appears on the big map.

(Yawn)

The position reporting feature has some potential to be useful, but that potential is seldom if ever realized. The main thing I've seen accomplished by APRS is that a lot of good equipment gets tied up that really ought to be utilized to provide emergency communications instead. Also, good ham radio operators get tied up, wasting time playing around with APRS when they could be doing something useful.

That's my "position" on APRS, folks... It's a fine example of wasted motion. - A distraction from the job of providing meaningful, useful emergency communications.

Yes well I got �160 out of the woman this morning and the rubber came off the side of the car with t-cut...left with a small crease in the door but I can live with that..

...it jusy annoys me that the beautiful big simple American cars of the 60's
and early 70's are now gone replaced with big ugly trucks with no better gas
mileage......

With a local, on board map in a spicific situation this in not a problem
like it is on findu's larger maps. Too bad Microsoft killed his maps - they
were really good in my area.

> The position reporting feature has some potential to be useful, but that
> potential is seldom if ever realized.

Hardly anybody uses it for RACES, ARES or ESDA activities. The local
ARES group only recently started to create interest.

> ...good equipment gets tied up ...operators get tied up,

> be doing something useful.

Could be said for the vast majority of amateur activities. It's a hobby -
an authorized way to waste time and money.

> Any help is useful, thank you!

I've collected information from various people who were involved in packet (APRS, BBS, etc.) and who participated in actual emergencies. e.g. Loma Prieta quake, coastal flooding, a tanker truck HAZMAT spill.

Here is what will happen in a real emergency.

At the very start, someone will instruct you to bring your 2M and 70cm radios, antennas, power cords and tools to a central location. They will explain that the trunked radio system exchange point is dead, and that the police cannot talk to fire and rescue anymore, and you are to solve that problem NOW. They will provide help to remove some antennas from your tower. When you arrive at the central location, you will be instructed to place the radios in specific emergency vehicles, and provide operators for them.

APRS is not of interest, packet is not of interest, solving the immediate problem is the ONLY thing of interest.

You will spend the next two to three days passing short messages between various emergency services, allowing them to coordinate their rescue activities. These will be messages like "The medical chopper should go at once to the clearing near Blah road and Blah street." "We need a backhoe to clear the road at Blah." "We have 10 injured people that need immediate medical attention, get someone up here NOW."

The reason Amatuer Radio is useful is that hams can move equipment to where it is needed, operate that equipment, and provide VOICE communications when the emergency services VOICE links are not working, during the first phase of an emergency.

Once search and rescue has finished their job, after a few days have passed, then the various agencies will start to file reports and requests for material / people, etc. At this stage what they need is email, the ability to send documents and spread sheets. The packet network can do this quite well, once the radios are returned to the packet sites and put back on air.

What I suggest is that you don't ask the question here, but ask the emergency services people in your area. Talk to the local sheriff, the fire marshal, the local hospital emergency coordinator. Find out what has happened in previous emergencies and how Amateur Radio might help solve their problems.

I've never had one of these people say that they needed help finding out where their vehicles are located ... other than by VOICE.

It isn't always that SUV's though. One day I'm with a friend in his

brand new Expedition. We're at a four way stop and there's an old blue
hair in a huge Plymouth Fury making the turn. I told my friend that she
wasn't going to make it and sure enough, she smacks right into the
drivers side of the truck.

The really nice thing about a large vehicle is that there's plenty of
space for radio and computer gear. :)

No military but I've driven all sorts of vans, large cars, etc. They
don't bother me at all but the SO needs to have a small vehicle because
the big vehicle is too intimidating.

This is probably because they do some magical stuff between your phone
and their Internet connection.  I expect the software they run does
everything from shrink images to blocking unusual data like yours.

John> Is there anyway that I can report and receive APRS data via the
John> Internet using Port 80 instead of the standard 10xxx port (I

If your home computer is always on the Internet and doesn't currently
have a web server running on it, there are ways to redirect traffic
such that any connection to your home computer's port 80 is redirected
to another server's port whatever, but I would not be surprised if it
didn't work due to the aforementioned magic.

John> Thanks, John

Jack.

As far as I can tell all traffic is allowed on the open ports. I've
set up an SSH server on one of the open ports and I can ssh over the
link. It works fairly well.

If the APRS software was socks-aware, I could use ssh (which has a
built-in socks server) to allow APRS to reach the Internet through my
home connection. I don't think WinAPRS supports socks?

I thought about this. It's a little clumsy, but still doable. Is there a way to change the hostname that WinAPRS connects to so I can put in my home IP?

Thanks,
John

Well that's good news. If ssh works, then APRS will almost definitely
work.

John> If the APRS software was socks-aware, I could use ssh (which has
John> a built-in socks server) to allow APRS to reach the Internet
John> through my home connection. I don't think WinAPRS supports

I'm not familiar with WinAPRS. I am one of the developers on the
xastir team, though, and xastir can work with socks.

John> Is there anyway that I can report and receive APRS data via the
John> Internet using Port 80 instead of the standard 10xxx port (I

John> can put in my home IP?

Again, I'm unfamiliar with WinAPRS, but it does seem to be a
reasonable thing to add -- and xastir lets you use any port, not just
10151 or whatever the default is these days. xastir will run on

Windows if the Cygwin environment is installed -- email me if you'd
be interested in giving that a try. I used xastir on my wife's
Windows XP laptop for a week-long jaunt around the American Southwest
recently and it worked fine.

John> Thanks, John

Jack.

Just go to GP.config and put 1200 bauds, and your serial.
Somewhere in the options you can choose your lang.
Thats everything you need, i think ;)

Hi all,

I have just upgraded my pc to a PIV and Win XP. However I have only 1 com port and am using it for rig control of my TS850S. I want to get back on air using my rigblaster plus. I am having problems trying to get rx and tx through a usb port. I have used both USB 1.1 and 2.0.

any suggestions appreciated.

Buy an RS232-USB adapter. They tend to be fairly buggy devices, but if
you look for one that uses the FTDI chips, you should be ok.

In fact, I would suggest you use the USB adapter for rig control, and use the serial port for the rigblaster.

The rigblaster uses the RS232 control lines to key the transmitter. USB doesn't transmit these signals faithfully. However, the rig control through the serial port uses the serial port as if it were a serial port. This the USB to serial adapter can deal with.

[snip]
That entirely depends on the adapter and the driver...

Hi There,

I want to use my MFJ 1278 DSP for APRS...

Now I need to get my MFJ 1278 DSP in the KISS mode..

Does anyone know HOW ??????

I tried allmost everything, but I can't get it working..

I don't have a 1278 but I do have a 1274.

The procedure to put it in KISS mode is:

```
KISS ON
RESTART
```

The CON and STA leds will flash three times.

To get it out of KISS mode
if running the KA9Q TCP/IP package the command

```
 param ax0 255
```

will exit KISS mode.

if not running KA9Q

The following three bytes

$C0 $FF $C0

must be sent to the TNC to exit kiss mode.

Also disconnecting external power and the internal
battery and waiting several minutes will exit KISS mode.

MFJ-1278B Chapter 6 COMMANDS

KISS ONIOPF Mode: Packet Default: OFF

The KISS interface is installed in firmware of the MFJ-1278B. KISS enables the MFJ-1278B to act as a modem for a host computer. Turning KISS on allows the MFJ-1278B to run programs such as TCP/IP and other programs which use the Serial Link Interface Protocol (SLIP).

Before enabling KISS, make sure radio baud rate and terminal baud rate are set to the desired values. The terminals baud rate that's determined at sign on is the same that will be used for KISS.

once the operating parameters have been selected, set KISS ON and then issue a RESTART command. The CON and STA LEDs will blink on and off three times to indicate that the MFJ-1278B has entered the KISS mode. Now you may call up a TCP/IP, or another host program that can use KISS or "SLIP".

If you are using the KA7Q TCP/IP program and wish to switch to the AX.25 mode of operation, you can issue the command: param axO 255, then press "RETURN". This command must be issued under TCP/IP "net>" prompt and in lower case letters.

Once the MFJ-1278B receives the "param axO 25511 command, it turns KISS off and will revert back to ordinary AX.25 mode of operation. When the MFJ-1278B is powered on again, it will sign on to the AX.25 operation mode.

If KISS is turned on and you have problem revert the MFJ-1278B back to normal AX.25 operation with the above procedure, you can also turn KISS off by removing JMP5 on the mother board. Reinstall JMP5 after a few minutes.

This is all I know. Hope it helps.

Mark S

Hi Folks,
 Thanks for the help so far

A follow up on my experience.
Have put rig control on USB and using comport for rigblaster.

Now : can RX ok on all dig modes. However I can't hear any sounds from the
external speaker plugged into the back of the rigblaster when I TX. The 850s
does put out a signal alright.

any info appreciated

Either they ignore the FCS, or they meant "not including ... flags",
```

or it is simply a mistake. I have several versions of the document,
they all have 136 but the paragraphs are numbered differently.

This might be off topic for the group, but does anyone here know if
amateur-style packet can legally be used on FRS and/or GMRS? I am looking
to build a low-cost data system for family use (I never could get my kid
licensed) and possibly for a small business. Also, is encryption legal in
these bands? I know that encryption is not legal in the amateur bands, but
I also know that at least rudimentary encryption is used on some business
radios.

Any help or pointers appreciated.

Dave

Well, I guess I could have done a little searching first: it seems that homebrew digital is not permitted in either service, any digital formats must be type-accepted. Does anyone know if there is any business service that allows non-standard digital transmissions?

And of course if you are foolish enough to download something from them
you'll have an even worse virus or they will have the ability to hack your
computer with the program they are offering.

Your way over my head in bits and bytes. I can only say this.
For maximum thruput in the least time period of msg traffic,
set maxframes to 7 and Paclength to 255. (providing that a

good signal is being provided at both ends of the link).

Folks,

I just got an old Kantronics KAM and want to try it out
with my Kenwood TS-440s.

Unfortunately the cable connection did not come with the KAM.

I'm not sure about the necessary wiring - does anyone here
have any experience with this combination or similar?

Thanks,

Bill

Hi Bill,

I used a KAM on my TS-680, I'll search the shack at the weekend and see what I can find for you. I worked packet and amtor mostly. (It was an old v4 KAM)

Hello to all

Just downloaded and am playing with psk31 software. I can receive ok as I have a cable for that(standard plug to plug). I would like to transmit but do not have the cable. Looking to homebrew something simple until I can afford the Rascal GLX. I mean something real simple like just some wires plugged to the appropriate pins on my mic jack. I have an IC 718. I just don't know which pins to go to. I'm thinking I want to trigger the vox . . . That just sounds like the easiest way.

| built-in socks server) to allow APRS to reach the Internet through my
| home connection. I don't think WinAPRS supports socks?

Even if APRS doesn't support socks, it's possible to make it work.

ssh can also just redirect a port, transparantly. Using openssh,

```
   ssh -L 1080:aprs-server:1080 remote-host
```

will log you into remote-host, and will also forward localhost:1080 to aprs-server:1080, with the remote connection coming from remote-host. (I don't know which port you're after. Replace 1080 with whatever it is. And if your ssh client supports this functionality, you can use it instead of openssh, but you're on your own about how to set it up.)

So, you run ssh on the same system that runs APRS (Cygwin comes with openssh if you need it, http://www.cygwin.com/) and configure it to talk to localhost:1080. If you cannot change the host that APRS uses (never used WinARPS myself, only xastir) then put that hostname into c:\windows\system32\drivers\etc\hosts (or wherever the file is) with an address of 127.0.0.1. Eithe way, WinARPS will then connect to localhost:1080, which ssh grabs and forwards along it's connection, then it initiates a connection from the remote host to aprs-server on port 1080. And then it all hopefully just works.

This doesn't work with everything, of course -- only TCP connections, and with things that don't open up additional ports and connections -- but it may be all you need to do to make this work.

Another option would be a VPN of some sort. If port 22/tcp is open, that may be all you need.

I dug thru some printouts and found I had a config.gp in
english so somewhere there were translated documents. I
was able to get everything working fine in W98 by booting
to "dos". I'm using AGWPE as well with the baycom and winpack
and that works great.

He's asking about minimum permitted frame length,
not ideal link-level parameters. Apples and oranges.
I'll reserve a very candid observation at this point.

I concur with Hank that it appears that the FCS or the
flags are ignored in the count of 136 bits. But, this is
what one gets attempting to implement AX25 2.2, which is
basically a freak that was published after active development
of packet standards had stalled.

I'd *really* suggest Ian implement AX25 2.1 and lessen the
chance of creating an implementation which does not interoperate
with standard TNCs.

EchoLink uses the windows program sndvol32.exe, it does not have it's
own audio drivers.

Run the Windows Sound Recorder program; record and playback a small
test file. Adjust the soundcard levels until you have good a good
quality recording.

When this works correctly EchoLink will.

Check you do not have more than one program loaded, possibly on
startup, that is using the soundcard. eg. Yahoo, MSN, Paltak etc.

If the Sound Recorder program will not work correctly then you need to
search out and install the latest drivers for your soundcard.

Ah ha! That was the piece I was missing. I didn't think to use the
local hosts file to change the IP. Great idea. I'll give it a try.

John

I'd love to be able to do IPSec (Nortel Contivity VPN client over this
link). I think there are a handful of ports that it uses so it might
be tough.

> Another option would be a VPN of some sort. If port 22/tcp is open,

That's where I was headed, but I think your solution above is much
simpler if not more elegant.

Thanks!
John

Hello Brian,

Good luck trying to revival your Baycom modem on an XP system... even with the AGWPE Pro high $$$$ troller, it should'n work.

I tested it and it still doesn't work at all!

If butchering the modem with an external power supply cures the problem, I wonder if it'is possible to make proper data transfer and not only connection + blablabla with zillion of retries.

 Hi Olivier...

 My XP laptop doesn't even have a com port so I've decided to try
 the soundcard on that. I wish somebody had a USB tnc because then
 I could use agwpe and get host mode with winpack. The host mode
 is what I liked best about TFPCX.

Hello,

Yes good idea! After getting my laptop I purchased a TNC2-Multi from IfD Germany which can be modified to work 19k2; It comes out of the box completely funktionnal, not as some kit kat TNC which need modules to be added.

I tested AGWPE and found Flex32 more efficient, especially with the soundcard (Soundmodem driver for Flex necessary).

For soundcard action or Host mode I use an UC232 type adapter but it doesn't work with the TNC in 6pack mode (Flex32).

Terminal programs are easy to find too, and Winpuke is not the best!

Paxon is the simplest and the easiest to work with (V.2.00.1114 runs with AGWPE also) you will just have to register on the home page to access to the download page for the latest version, but if you don't want to use AGWPE, the 1.00.1042 version is good too. It's really worth trying it when you have access to any BBS type except FBB!

WPP is a good compromise if your BBS is an FBB type (the worst) and it uses a bull. list as Winpuke but supports also Bin, BinSplit and Didadit data transfer protocols (Paxon too).

You can find all infos and links at http://www.uspacket.net/

For WPP, you'll have to go to: http://wpp.dc6hb.de/
The site is a little bit messy because it's in german and the english side of the portal is really not overcrowded...

I have for sale 2 cables from Buxcomm, never used, still in the original packaging. I bought these for projects that I never did. I have the following cables: (5DI8MX) TNC with 5 pin DIN plug to Icom 8 pin Mic and ext speaker jacks (KVI8MX) Kantronics 9 pin radio port (plug is a 9 pin male serial plug) to Icom 8 pin Mic and ext speaker jacks. Best offer.

SB QST @ ALLUS $USPN_Q008
USPN-Q008 Q15x25 BBS Fwd
QST de USPN
USPN Bulletin 008 USPN_Q008
From USPN website
http://www.uspacket.net
To all radio amateurs

Q15x25 mode is a wide digital mode that gives an effective throughput of
2500 baud
on HF through the use of 15 psk streams at 88.3 baud each. Its bandwidth is
similar
to that of PACTOR III.

A method for utilizing a Q15x25 gateway for HF message forwarding is
outlined
in a new tutorial at USPN. A new Q15x25 mailing list has also been set up
for
interested SYSOPs, as a forwarding net utilizing this new digital mode is
developed.

The gateway software is free and uses a soundcard.

The new Q15x25 Tutorial can be found in the "Tutorial" page at USPN:

Yeah, sorry. Encryption's not legal on the FRS/GMRS. I'm pretty sure that commercial comms aren't legal with 'em either. I know we see some stores and shops using them from time to time but it ain't what it was intended for. I couldn't venture a guess about commercial licensees. They've got to be paying good money for the bandwidth and have a legitimate need for privacy ($$$). Good luck.

Anyone here get Paxon working ok with AGWPE? It starts to
work ok, connects fine but then it doesn't send any more
packets. I can see nothing going out in the monitor window.

Have you tried Flex32 with Paxon? If you can't get AGWPE to cooperate, try
it with Flex32.

Screen-shot tutorials on Flex32 and on Paxon are in the "Tutorials" section
at USPN.

So like this?

```
 c n1abc
 Connected to n1abc
 Then I send n to see a list of nodes
 to connect to a node on the list i send:
 c n1def v n1abc
```

Is that right? If so why doesn't Winpack require that?

Thanks,
n2peu

It has nothing to do with WinPack. F8BOE is talking about digipeaters
and you are talking about nodes - they are not the same thing.

If you connect to a node, and you want to connect to another node, say

NODE2, from that node, then you simply use the command   C NODE2

> however sounds very implausable to me!!!

Packet with a sound card uses exactly the same protocol as packet with a
TNC - AX25. Therefore it uses a CRC exactly the same as packet with a TNC.

Hi-San !,

"Tokyo Tsushin Kogyo" so called Sony in 1955, sold at that time a new transistor, competitor to the first TR-1 fromTexas Instrument that entered the US and European markets and did a real revolution.
For marketing reasons, M.Ibuka and his partner Akio Morita changed its name in "Sony". A young, dynamic and very agressive company was born. You know the rest of the story.
For your information, in 2004 revenues (ttm) of Sony Corp., SNE, http://finance.yahoo.com/q/ks?s=SNE, reached approx. $70 billions for a gross profit of $20 billions, his annual earning growth exceeded 735%, with 16% of his shares held by institutions and insiders, not a small company...
Not only Sony became a major company represented worldwide including to the small dealer located down to your street, but he has extended his know-how in all personal and domestic activities : computing, imaging, audio, video, television, wireless network, robotic, and more. As they say themselves, welcome to the world of Sony, http://www.sony.com !

Since that time, within two generations Japan became in spite of everything one of the major Powers in the world. Today in all technical areas, from the underground railway to the spacecraft, the efficiency and reliability of japanese and alike components exceed by far the quality of any European or US product. Look around you : the most reliable cars are japanese or korean (5 first, even before Germans), the best transceivers are japanese too, and in all your home, if you look closely, most of your equipements are made in Japan or their vital components (chips, etc) are made in the country of the rising sun.
The small country who so-called lost face is winning the economical war.
Today however the sunny horizon of our friends-San displays some dark clouds, http://www.dallasfed.org/research/swe/2003/swe0304c.html, they have a lot of excellent competitors in JA, VK, UK, F, K, etc but they haven't loose their place yet, they are winners.

>   Joe

I have operated a VHF port on my packet BBS that was soundcard-based, back when I used the Win95 version of FlexNet. The DOS version of FlexNet will do it too. That soundcard handled the VHF needs of a BBS, a DX cluster, and my personal keyboard, all at once. It never failed, and never gave any trouble in a year's operation. I finally shut it down when I upgraded to a better computer running a more modern OS. The software was intended for Win95 and would not work with Win98SE, so that was that.

On HF, it's a different story. There are numerous HF soundcard modes, but none of them are intended or designed to be used in conjunction with BBS or any other kind of server software at all. It's all end-user stuff.

The only soundcard mode I have gotten to work with packet BBS software on HF is Q15x25 (Newqpsk) mode. I set it up and operated a Q15x25 BBS on HF for 24 hours on 20 meters, to check for function. Of course, there was nobody to connect to the BBS, but I had already done on-the-air testing of Q15x25 on HF so I knew that it "worked". After a day, I shut it down and went back to HF packet, where there were other stations to communicate with. No matter how advanced the mode; If you have no-one to connect with, you're not going to move much data.

Q15x25 mode uses 15 psk streams @ 88 baud to get an effective 2500 baud throughput. Despite sounding funny, and being 15 psk streams wide, Q15x25 mode works exactly like packet. What I did was to create a Packet/Q15x25 gateway (Using Flex32) and digi'd through that gateway to HF from my BBS. The packet BBS "talked" to the gateway over a 19.2kb fulldup serial link. (The whole mess was a two-computer setup.)

So, as far as operating a server on HF goes, I think it's fair to say that the soundcard modes are currently pretty close to being worthless. Q15x25 has potential, but I don't notice anybody getting in a big rush to utilize it. That makes it worthless, too. I'm not trying to be negative or critical here, but that's just how it is at this point. - And tomorrow may be another story.

My idea for a killer HF digital mode over a soundcard has no name, but would involve a half-dozen or so psk streams (same overall bandwidth as packet), with all but one stream transmitting in multicast mode. One PSK stream is for a control/chat channel while the others send the multicast data stream, slightly staggered in time so that each of the four redundant data streams provide error-correction ala' multicast protocol. (The same data is transmitted on five psk streams, each one progressively delayed so that the streams provide "fills" for data lost to static crashes, poor propagation, etc. on the first stream, second stream, etc. etc...) The data gets five chances to make it through. I would have an option of using the control/chat channel as another redundant data stream, making it six.

This mode works like the low-power, constant boost ION engines that NASA has on some of their satellites. Despite it's low data rate (300 baud on HF) it still moves an impressive amount of data because it's constantly on the job, not operating in fits and starts like packet or the arq modes. Constant boost. At 300 baud, a multicast data stream can move around 5 megabytes a data per day. (5 MB / Day) which is pretty impressive when combined with on-the-fly error correction.

Another great feature of this mode is that it is a connectionless mode like APRS... Anybody with an HF receiver and a computer can decode the multicasts and receive the data. One server station can send data to an unlimited number of receiving stations simultaneously, instead of just one. When you combine this feature with the 5 MB/day throughput, what you have is a killer HF data mode that will make just about anything else on HF look very, very slow. - And I am not leaving PACTOR III out of that comparasin, neither am I blowing smoke out of my shorts or trying to feed anybody any "farina". This is for real. - And it will do it within the same amount of bandwidth that a packet QSO takes up.

Programmers: Take note!   Contact me for details, protocol info, etc. Here's a good chance to make a name for yourself in the amateur community.

Once we get the FCC to write restrictive rules, it's very hard to remove them.
The only unattended mode allowed is packet using 2FSK, and if you can't run
unattended, why bother.  Thus the stagnation and apathy in digital radio relay.
Meanwhile psk31 and others are very popular as the attended mode.

Until we get rules that allow experimentation, ham radio will always be about the
white man with the most money and power, rather than any other feature/future.

Actually, that is not so. There are and have been unattended digital station operating modes besides packet for quite some time. In fact, unattended RTTY and AMTOR mailboxes predate packet. Currently, there are dozens of unattended PACTOR and CLOVER stations.

I would say "Before you disparage the hobby, try getting your facts
straight." but I realize that very few ham-bashers have any interest in the
facts. - They just want to pee on everybody's party, miserable souls that
they are.

In article <4056dfb7$1_2@news.vo.lu>,
Toanswermeinprivateusehttp://www.astrosurf.com/lombry/post.htm says...

>
>Look around you : the most reliable cars are japanese or korean
>(5 first, even before Germans)

This is certainly the first time I've heard Korean cars described as reliable! They are getting better, however. Certainly, when they first came to the States, Hyundai was the laughingstock of the automotive industry.

In general, the Japanese brands, Toyota, Honda, Nissan, and Subaru seem to be very reliable. Suzuki and Isuzu do not seem to be anywhere near as reliable. I wouldn't write home about Mazdas and Mitsubishis either. In this country, I've seen lots of Mitsubishis spitting blue smoke out the tail pipe. Hard to believe that, as a class, Mitsubishi owners are harder on their cars than owners of other cars.

Huh? WWVH in Lihue used to come in five and nine everywhere in Hawaii.
On AM car radios, tape recorders, sometimes even rice cookers.

I base my opinion on the last car magazines "Car of the world" and alike
that sorted cars according various criteria, sales, problems/reliability,
customer satisfaction, etc. I didn't said that ALL JA or HL cars were
perfect, or I should...

I agree with whoever said WWVH in Hawii is l/c and on same status as wwv in Colorado, so these "skyscan" clocks should perform as specified. I found though that my latest one will keep time right to the second for a period of time, the I have to move it upstairs where reception is better and leave it there for 24 hours. Once reset to exact time tick I again put downstairs in the shack and its good for another momth or so. I fail to see how the clock reader can discriminate between WWVH (on Kauai) and WWV in Colorado.

Joe (aka kilroy)

That may be the case Scott, but the 'atomic clocks' they are speaking of use the WWVB signal from Ft. Collins, Colorado on 60 KHz to set their time automatically.

That signal may indeed not be propagating well enough to be of use in Hawaii.

But most atomic clocks use WWVB on 60 khz out of Fort Collins. WWVH, to
my knowledge, only uses HF freqs (5, 10, 15 Mhz). But yeah, I'm sure the
rice keeps better time than the people who eat it. :)

I heard the LuaLuaLei transmitter a lot, but not WWVH, when I lived there.
500kW or 1MW IIRC, somewhere around 24kHz.

The topic is WWVB, the binary signal. WWVH is the voice signal, which an autosetting clock will not understand.

John,

I am probably not much help as I am Mac user and I found using the SignaLink SL-1+ solved 99% of the interface isseus. The cool thing about the �L-1+ is the AutoPTT and you do NOT need a comm port connection. Just audio in/out of your sound card and the SL-1 tells the TS-570 when to xmit and when to listen. I am using the new DarwinPSK (Mac port of LinPSK) software. Good luck!

They don't use WWV or WWVH. They use WWVB 60 kHz out of Fort Collins.

I thought WWVH also had BCD data a couple times an hour? Or has that been
stopped along with the Omega navigation beacons?

Is there no VLF facility in Hawaii comparable to WWVB?

WWVH is the 2.5, 5, 10, 15, and 20 MHz voice and data transmitter, it's on
exactly the same freq as WWV in Ft Collins. If you listen, there's a
silence before the guy on WWV speaks, that's for the lady from WWVH to talk
first. (very polite :)

The clocks use WWVB which is a 60 khz signal.
Interference from LuaLuaLei may make that impossible to pick up.
There also used to be a Loran transmitter around 100kHz IIRC, on the north
shore of Oahu, but they may have taken that down now.

The data sent on 60 kHz by WWVB isn't transmitted by WWVH. Here's a
chart of the coverage areas of WWVB and it looks like it has a decent
chance of being received in KH6-land at certain hours, like 0800 UTC.

How in the hell can the CLOCK detector tell any difference between
the time signal from WWV or WWVH. They are both on exact same
frequecies, the time tick is identical on both !!!!
Kokomo Joe
WWVH on Kauai has a consistantly strong signal. Albeit at times
is totally off the air several times in any given month.

If the signal format is *exactly* identical to WWV it has a continuous
time signal being sent as a 100 Hz tone at 1 bps. If you can't hear
it on your radio (because of "comm grade" headphone or speaker or
ears), you can use skysweeper in free demo mode and see the bits clear
as day in the waterfall display.

Here is the WWV/WWVH time format:
http://www.boulder.nist.gov/timefreq/stations/wwvtimecode.htm

But as been mentioned before, this is a different format than what is
used by WWVB for synchronizing clocks.

But that's not what I said.  WWV has its own 1 bps digital signal,
every minute.  If, as you say, WWVH has the same format, presumably it
also has the same 100 Hz digital format as WWV (no suffix).

I have an ICOM 736 and a MFJ sound card interface that I use for RTTY.
I was wondering how the CW mode works. I think the transceiver needs
to be in sideband to send cw with hamscope am I correct.

Once again, the clock the individual wants plans for uses the signal from WWVB in Ft. Collins, Colorado on 60 kHz.

That was a Navy transmitter, not NIST. I was stationed at Lualualei
for almost two years in the mid '70s. I wonder if it is still on the
air now that they have switched most of their circuits to satellite.

As we as aspiring _REAL_ Radio Hams communicate in
difficult circumstances without requiring BBC-quality 5 'n' 9
both ways, perhaps we should just take BPL in our stride?

Perhaps it will act as a filter to remove those who are
not _REAL_ Radio Hams but are just CBers-Masquerading-As-Radio-Hams
from the bands?

No, the second ticks are 5 cycles of 1000 Hz on WWV and 6 cycles of
1200 Hz on WWVH.

We were there at the same time. 69-87 for me.

I once had to put in a buried seismic alarm system right across the street
from that transmitter.
Took some interesting filtering on the signal lines, not to mention three
weeks to ditch through the coral.

     You're right a wwv or wwvh clock both receive and decode
the same manner. Both wwv and wwvh transmit at 2.5, 5. 10, 15, & 20Mhz.
There is no 60Khz on Kiuai.

     Yes, not to belabor the subjct, but WWVB is 60Khz,
while WWV, & WWVH are 2.5....................20Mhz.

There is no voice with WWVB. Howver, for calibration purposes
WWVB is more stable, and accurate.

I have one of the small desk clocks that synchronizes to WWVB at
night. It auto-adjusts the internal crystal (or says it does)
to keep itself going during the day. I've found that it maintains
accuracy very well: certainly good enough for anything short of

atomic physics.

I live in the NorthEastern U.S., where the signal is relatively weak
(look at the maps at the URL a previous poster supplied) and don't
have any significant trouble with it. I looked at the NIST web
site, and I think they said something about boosting the power of
the WWVB signal: so if you had trouble with it before, it might
be worth trying again.

They are ocasionally on ebay. Then there is the venerable Heathkit clock, which decoded WWV. I had a Heathkit for a while, but sold it. It was really not very stable compared to WWVB. I have several WWVB clocks, and receivers. Both are commercial grade, and very stable. The consumer clocks are very accurate, but not good for calibration.

Has anyone tried this? It can be downloaded from the web site of the same
name and works great, but it's a trial version and the person who wrote it
died and now there doesn't seem to be anyway to register it or unlock it so
it can be used after the 21 days expires. Anybody found a workaround?

Thanks

The best software, DSP or otherwise for a Radio ham to use
is that which he writes for himself.

Otherwise - try backdating your PC's clock by 3 weeks every
21 days?

Looking for Win98-compatible logging software for use on a P-200MMX Compaq
laptop with a thundering 32MB of RAM. Users wish a lookup function; when a
callsign is entered, they want to see a popup with the name & station
location.

This is intended for packet use (and, yes, will be scrounging for memory
for this Armada 1590). Oh, yes, free would be preferred, since this is for
the county ARES unit.

What do y'all use for logging?

Thank you kindly.

Well I cant specifically help you with the software, but take care to
remove as many other memory hogs before you run it. 32MB is "marginal"
in a W98 environment. You'll be swapping RAM to hard disk if you have
too many apps and TSR's running.

This means no virus scanner or preloaded stuff in the start group or
"run" in the registry. (I wont type the whole key) Might even be worth
wiping the current build,installing W98 from scratch and then doing all
security (only) updates. Also be wary about loading IE6 as that seems to
use more memory than 5.5

Cheers Bob VK2YQA

What do you definitely need?
A logging program or a packet program?

I have some www adresses for free (FOR AMATEUR USE ONLY) programs.

But I doubt this would be for amateur radio use... Nevermind we all are
happy CBers now!
Look for the Winlog32 full (registered) version which has maps You can
easily find it witha good search engine.

Yes, that's understood. We are searching for more RAM for the laptop, and
perhaps you overlooked the statement in the original posting:

>>will be scrounging for memory for this Armada 1590)

>This means no virus scanner or preloaded stuff in the start group or
>"run" in the registry. (I wont type the whole key) Might even be worth

>security (only) updates.

That's been done, already.

It will not be used for web browsing. Packet & logging, that's all.

Hi All,

Can anyone tell me if Timewave still exist. I have sent numerous email's and faxes requesting PK-232 upgrades (MBX and DSP) and have had no response. In desperation I sent requests to Timewave distributors in Europe to the same end - no reply. Is Timewave / Pk-232 / Upgrade used in the same sentence a dirty word?? Or are people (and fellow Ham's) who are not from the US / Europe count for nothing?

Anyone that can help with these upgrades, I would be grateful to hear from you.

I got a PK-232 on ebay a few weeks ago, and called Timewave to get the MBX
upgrade... I had no problems... got the package in about 2 days, installed
the
upgrade, and an hour later was on the air with the upgraded PK-232.

Gary,

Maybe you need to talk direct to Timewave.  sales@timewave.com or th web
site at http://www.timewave.com.

Timewave does exist and is doing quite well, even in this poor economy.

Rick - W4PC

You'd probably be better off using Linux. AX.25 is built into the
kernel as a driver; you can browse the source if you want. Minicom
comes with most distributions. It is a reliable terminal emulator.
Their are probably others but minicom seems to be the most prevalent.
The Debian GNU/Linux distribution has a whole section of software
dedicated to ham radio.

Yes, that is exactly the same as what I said.
Why do you think otherwise?

Allow me introduce the PrimeKit PIC Development Board II.

First, here is the link:
http://www.primetec.pt/products.php?sec=2&cat=1&prod=6&lang=en

or
http://www.primetec.pt/index_en.php

PrimeKit PIC DevBoard II is a development board for Microchip� PICmicro� micro-controllers, and programming of Microchip� PICmicro� microcontrollers can be learned, by exploring the 12C/Fxxx, 16C/Fxxx, and 18C/Fxxx families.

PrimeKit PIC DevBoard II configuration is done by Jumpers, that allow activation/deactivation of all peripherals. All peripherals that share the same micro-controller BUS, are in parallel. If in need of any outside component testing, the provided Proto-board may be used, as well as the flat-cable sockets.
The Radio Transceiver, USB and Ethernet modules are optional, although they may be supplied with the PrimeKit PIC DevBoard II.

You may find this on the webpage, but here it goes

Peripherials included onboard:

Momentary switch buttons and 12 keys numeric keyboard;
16x2 chars LCD Display;
Leds BUS and 7 segments HEX Displays;
USART (Serial Port);
USB (Universal Serial Bus);
Ethernet port accessed by I�C �
BUS I�C � , SPI� and CAN BUS;
Radio Transceiver for 433.92MHz;

Crystal Oscillator or external fixed/variable clock;
Temperature Sensor accessed by 1-wire� technology;
Triac for AC/DC power circuit switching;
EEPROM Memory accessed by I�C � technology;
Real Time Clock accessed by I�C � technology;
Analogue Inputs to use with PIC's ADC's;
Total access from outside to the micro-controller ports;
External pulse input;
ICD (In Circuit Debugger) - Step-by-step debugging;
Proto-board for auxiliary circuit testing;
* Compatible with RS232/USB Bootloader. *

Thanks very much for taking a moment to read this email.

Gary,

They are very much in business. I don't undertand why you are have problemss. Try

http://www.timewave.com/amprods.html

I needed some parts for my old AEA PK-232 about a month ago and they were great.

Dick, AA5VU

Wanted: 13-Pin DIN A/B Switch

This may sound like a strange request but I have a need for a 13-Pin DIN
A/B switch. The reason is I use a SignaLink SL-1+ interface and a PK-232
and I am tired of having to remove the TS-570 to make the switc over.

I could make one but would prefer to buy on from someone like MFJ. I
don't think they make such an item

What do you need to know Dick? I've installed 3 in PK-232's and one in a
PK-900.

Buy a serial port A/B switch for a computer, they are easy to convert for your purpose. You can alter the switch box with 13-pin connectors, or leave it as is, and buy 23-pin serial connectors, some wire, and 13-pin connectors to make adapter cables.

These serial port switches are handy for lots of similar projects/purposes, and are inexpensive.

HI,

Does anybody have a circuit that will
decode the WWVB signal,and output to a clock
led circuit?

TIA,

Dennis

You might want to search at http://www.google.com using the terms wwvb decoder clock. There's plenty to select from and a number of kits available.

Go to Google and search for "atomic clock". In the first 20 or 30 listings you should find hobbyist sites that have diagrams and maybe even kits.

Hi,
Unless you want to have fun building a clock, there are many such clocks
or watches out there. I wear a watch. Very accurate in time keeping.

Yes, I have one of these clocks also. The thing is, these clocks are set 6 times in a 24hr perod by the WWVB signal. The rest of the time the time base is an ordinary crystal. I want my clock to be set on a more continous basis. This could only happen with the continous decoding of the signal. This is how the "professional" clocks, such as those made by Spectracom work.

You might consider the old Heathkit clock, which still turns up cheaply
at hamfests now and then.

If you build your own, make sure you use nixie tubes.  That's important.

Observatories often use a GPS to feed their computers accurate time. That may be a solution worth looking into.

Why not use a computer and an NTP server?

You'll find that most of the schematics on the net for atomic clocks are
of the crystal variety-they set once or twice a day with WWVB and the
rest of the time use a crystal. You'll have to do some digging to come
up with something that does continuous decoding, but I'm sure it's out
there.

What I did is use a GPS-disciplined receiver to give me a highly accurate 10 MHz standard. The receiver costs $250 from www.buylegacy.com but you'll end up paying (way too much) for a power supply/line lump and the antenna. I also spent money on software to use with it on my win2k box.

Every 10 minutes that software updates a web page with the sky view and how the high-grade crystal oven is functioning, including estimated error over 24 hours if it loses contact with the GPS satellites.

Hi,
I want to setup a weather APRS station in my QTH. I use a 1-wire weather station: TAI8515 from AAG Electronica (Dallas Semiconductor), with a DS9097U serial adapter connected on COM1. I run UI-View 32 (latest release, registered!) on Windows 2000, and I transmit on 144.390 MHz with a Kantronics KPC-3 TNC (I would like to use AGW sound card driver as well... this part already works fine).

I would like to transmit weather infos (from 1-wire) on the air with UI-View. I installed "UI-weather" add-on (from Andy, M0CYP), but it seems I need another software or driver to make UI-View able to read (and transmit) data from my 1-wire port.

I have heard about TAPT T-238 interface, but I don't want to use an hardware option.

Does anyone know which soft or patch I should use to make 1-wire port "talk"
to UI-view ? How do I configure this ?

Thanks. 73

TK,

For a normal 'ordinary' Consumer Time Standard that is Accurate to
within a Tenth of Second: Every Minute; Every Hour; Every Day . . .
The above Time Synchronization Process is more than adequate.

~ RHF

If you ask in the UI-View mailing list on Yahoo Groups, you will find

people who use that wx station with UI-View. They will be able to tell
you exactly what you need to do.

Mine is set only once per day, sometime between midnight and 4 am.

I was under the impression that the reason this was done is that the
signal is too weak to be decoded during other times of the day. In fact, I
have some (admittedly very inexpensive) atomic clocks that have *never*
decoded the signal here in Florida.

Gerry and others,
Yes I have went thru 2 of those dam things already. A big white one with normal minute and hour hands which I threw away after a few weeks of trying to make it behafe. Then got the more or less square shaped one with wooden panels on eachside of the clock face.   Shows day date weekday (seconds or indoor temp) Outdoor temp.   Has an ICON top center thats supposed to show up black if WWV is being heard. Mine rarely does unless take it upstairs and point it north/south. Then the icon (wwv) shows very dimly.   Mine is supposed to access the WWV sig during hours from midnight to 6am only. But still the ICON rarely shows up. I hear the people who sell them are very helpful and will even replace your clock if you cant resolve the problems. Their ph nr is   1 (800) 972-0292 and ask for Shelly.
Kokomo Joe (in Hawaii)

Are you sure your not talking about wwvb, and not wwv. Or in
your case it would be wwvh.

Forget about getting an atomic clock to set in Hawaii. The signal is
simply too weak. Atomic Time (who I bought my dual time clock from) says
that it helps if you point the antenna (apparently they just use ferrite
rod antennas-just like in a cheap transistor radio-to recieve) towards
Fort Collins, which is due east of my QTH.

Yes, that's the impression I got too. Somewhere on the net I saw a
diagram of WWVB's coverage area-it covers all of North America at night
and just a little area of the Rockies during the day.

For Sale - Texscan Sweep Generator model SG-677U $99.00 + shipping &
handling.

Unit is mounted in a very sturdy military carrying case but can be
removed for rack mounting. I have no way of testing other than making
sure it turns on and the dials and gages looks like they are working,
so I am offering on a money back guarantee (less return shipping
cost). Pictures can be found at www.dentonmarket.com or contact me at
mikelgiles@bfesystems.com

I am new to PSK31 and have noticed stations giving out IMD reports.

How do you know what's good or bad? I have been printing stations with
solid copy but the IMD meter only shows -12 and sometimes -5.

Dick - AA5VU

Dick - sometimes the IMD readings vary a lot, and the reading can be confused by other strong stations in your receiver passband. So you have to be careful about taking the reading.

In general, -13 dB is the worst that a PSK31 signal can be. This indicates 100% compression of the audio. Sometimes you will see worse readings, due either to problems other than overdrive, or other nearby signals. Soundcard output levels are about 20 dB higher than the microphone input level of most rigs. A 20 dB. attenuator between the soundcard and the mic input helps a lot (two resistors).

PSK signals are filtered by the transmit software, to limit their bandwidth. If you overdrive the transmitter and cause limiting or compression of the signal (such as showing any ALC), that compression causes spectral regrowth -- i.e. the signal gets wider because of it. Some people like to see all the meters up high. However in this case, the amount of power dedicated to the main signal slightly decreases, because more power is going into the (unnecessary) 3rd, 5th, etc sidebands. So this actually hurts the strength of the desired signal a little.

Signals with IMD of -21 or so are reasonably clean, and you can ocasionally see signals with IMD near to -30 -- a very good quality signal.

Unfortunately the majority of PSK signals that I have seen have an IMD close to -13 dB.

-- Tom

MAKE MONEY!!!MAKE MONEY!!!

MAKE THOUSANDS!!!

I found this on a bulletin board and decided to try it: I don't care about the useless pre-fabricated crap this message usually says. All I say is, it works. Continue pre-fab crap.

WELL GUESS WHAT!!!

Within seven days, I started getting money in the mail!! I was shocked!! I figured it would end soon, but the money just kept coming in. In my first week, I made about $25.00. By the end of the second week I had made a total of more than $1000.00!! In the third week I had more than $10,000.00 and it's still growing!! This is now my fourth week and I have made a total of $42,000.00 and it's still coming rapidly. It's certainly worth $6.00 and six stamps, and I have spent more than that on the lottery without ever winning!!!

Let me tell you how this works and most important, why it works..........
also make sure you print this out NOW, so you can get the information

off of it, as you will need it. I promise you that if you follow the directions exactly that you will start making more money than you thought possible by doing something so easy!!

Suggestion: Read this entire message carefully!! (Print it out or download it)

Follow the simple directions and watch the money come in!! It's easy. It's legal. And, your investment is only $6.00 (Plus postage) !!!

IMPORTANT:

This is not a rip-off, it is decent; it's legal; and it is virtually no risk - it really works!! If all the following instructions are adhered to, you will receive extraordinary dividends.

PLEASE NOTE:

Please follow the directions EXACTLY, and $50,000 or more can be yours in 20 to 60 days. This program remains successful because of the honesty and integrity of the participants. Please continue its success by carefully adhering to the instructions. You will now become apart of the Mail Order business. You are in the business of developing Mailing Lists. Many large corporations are happy to pay big bucks for quality lists. However, the money made from the mailing lists is secondary to income which is made from people like you and me asking to be included in that list. Here are the four easy steps to success.

STEP ONE:

Get six separate pieces of paper and write the following on each piece of paper "PLEASE PUT ME ON YOUR MAILING LIST." Now get 6 U.S. $1.00 bills and place ONE inside of EACH of the six pieces of paper so the bill will not be seen through the envelope (to prevent thievery). Next, place one paper in each of the six envelopes and seal them. You now should have six sealed envelopes, each with a piece of paper stating the above phrase, your name and address, and a $1.00 bill. What you are doing is creating a service.

THIS IS ABSOLUTELY LEGAL!!!!!

You are requesting a legitimate service and you are paying for it!! Like most of us I was a little skeptical and little worried about the legal aspects of it all. So I checked it out with the U.S. Post Office (1-800-238-5355) and they confirmed that it is indeed legal!!

Mail the six envelopes to the following addresses:

1)S Luest
P.O. Box 366
Garden Grove, CA 92842
USA

2)R. Ansems
Gen. Foulkesstraat 5
4641 BW Ossendrecht
Netherlands

3)B. Loblaw
49 Gaydon Way
Brantford, On
Canada
N3T 6P7

4)BP Douglas
105 Rustywell Prk
Yeovil
Somerset BA20 2NB
UK

5)PV Martin
32 Wyndham View
Yeovil, Somerset BA21 5DA
UK

6)Elgin freeman
1993 w Riverbend Cir
Bullhead City,AZ
86442

STEP TWO:Now take the #1 name off the list that you see above, move the other names up (six becomes 5, 5 becomes 4, and etc.) and add YOUR NAME as number 6 on the list.

STEP THREE:
Change anything you need to but try to keep this article as close to original as possible. Now post your amended article to at least 200 news groups. :
(I think there are close to 24,000 groups) All you need is 200, but remember, the more you post, the more money you make!! This is perfectly legal!! If you have any doubts, refer to Title 18 Sec. 1302 & 1341 of the Postal Lottery laws. Keep a copy of these steps for yourself and whenever you need money, you can use it again, and again. PLEASE REMEMBER that this program remains successful because of the honesty and integrity of the participants and by their carefully adhering to directions. Look at it this way. If you were of integrity,

the program will continue and the money that so many others have received will come your way.

NOTE: You may want to retain every name and address sent to you, either on a computer or hard copy and keep the notes people send you. This VERIFIES that you are truly providing a service. (Also, it might be a good idea to wrap the $1 bill in dark paper to reduce the risk of mail theft). So, as each post is downloaded and the directions carefully followed, all members will be reimbursed for their participation as a List Developer with one dollar each. Your name will move up the list geometrically so that when your name reaches the #1 position you will be receiving thousands of dollars in CASH!!! What an opportunity for only $6.00 ($1.00 for each of the first six people listed above) Send it now, add your own name to the list and you're in business!!!

*****DIRECTIONS FOR HOW TO POST TO NEWS GROUPS!!!*****

STEP ONE: You do not need to re-type this entire letter to do your own posting. Simply put your cursor at the beginning of this letter and drag your
cursor to the bottom of this document, and select 'copy' from the edit menu. This
will copy the entire letter into the computer's memory.

STEP TWO:
Open a blank 'notepad' file and place your cursor at the top
of the blank page. From the 'edit' menu select 'paste'. This will paste a copy
of the letter into the notepad so that you will add your name to the list.

STEP THREE:
Save your new notepad file as a text file. If you want to do your posting in different settings, you'll always have this file to go back to.

STEP FOUR:
You can use a program like "postXpert" to post to all the newsgroups at once.
You can find this program at <http://www.download.com>.

Use Netscape or Internet Explorer and try searching for various new groups (on- line forums, message boards, chat sites, discussions.)

STEP FIVE:
Visit message boards and post this article as a new message by highlighting the text of this letter and selecting paste from the edit menu. Fill in the subject, this will be the header that everyone sees as they scroll through the list of postings in a particular group, click the post message button. You're done.

Congratulations!!!!!!

THAT'S IT!! All you have to do, and It Really works!!!

Best Wishes

Was it ever a good brand? Years back I wanted to put together a component system, so I asked the guys in the repair shop what's a good brand (name the component) to buy. Always got the same answer. Anything that's not Sony. They said they repaired more Sony stuff than everything else they sold put together.... Was that because they sold more Sony stuff or because more Sony stuff broke? I dunno....

73, Jim KH2D

IMHO none of the sound card tools fulfill the requirement of
arq (formerly known as automatic error correction now known
and CRC checking). Hence they are not used where msg integrity
is the prime consideration from origin to destination and the
msg passes thru many gateways and channels to reach its final
destination point.

Packet and Q15x25 mode have error correction, though not arq. Either of
these will send data error-free, and Q15x25 has impressive throughput.
Q15x25 uses psk streams, proving that psk can be utilized with effective
error-correction. It's not arq though.

Hello,
I'm looking for a decoder for AIS signals from shipping information.
It is a kind of APRS for commercial ships in the VHF. Modulation is GMSK
9600 baud packet.
Is there a soundcard decoder or a simple home brew decoder ?
Thanks PE2ENE(at)AMSAT.ORG

I'm trying to diagnose a problem with my setup-Rascal and kenwood ts570d

and winpsk. The software (running under win xp) keys the radio (which I have
set for USB) but there is no carrier produced. If I switch to fsk or fm i
can see a carrier along with the transmit.

I've looked at the winpsk settings and the radio's menu and don't see
anything in particular. I checked the sound mixer settings and there's
nothing muted on playback. So I'm probably missing something simple.

Thanks for any suggestions.

Ref below.   In that case if your referring to packet via a tnc,
I concede yes its just as error free as Pactor or any other mode
useing a TNC. Useing a sound card only with soundcard software
however sounds very implausable to me!!!
                          Joe

This works well for me - Lean slightly forward, apply gentle pressure with index finger to button on radio labelled PWR.

Hi all

I never thought I'd get to post the one post to both the Amateur and Rail forums but its funny how things converge.

First for the non-Amateur readers here a brief explanation about APRS. APRS is a system using a GPS receiver, a two way radio and some other bits of electrical equipment. You put this combination somewhere and it transmits its location on earth by radio to other radios and eventually into the Internet. You can then log in on the Internet and look at where the setup is located.

Here is an example of an actual amateur radio that has been tracked in a mobile setup.

http://www.findu.com/cgi-bin/find.cgi?call=VK3TI-9

The maps on this site are not crash hot but better maps are indeed possible.

Anyway rail readers will have recently noted the opening of the Ghan railway to Darwin. My idea is thus. Wouldn't it be a great idea if the Amateur radio community could get together with the various train operators and put in Amateur GPS tracking setups on all Australia's major interstate passenger trains? Both Amateur Operators and rail enthusiasts could then log into the internet and look at where each interstate train is located. There are gaps in the the system ie there are not that many receiving stations in the outback but it would be useful along the east coast. Maybe later a more advanced system could transmit screenshots from a digital camera mounted on the front of the train.

I believe this kind of setup has been done on at least one US train. Maybe it could work here? It would help publicise our rail network here and overseas.

cheers Peter

Droll... very droll...

Trouble is that there is still a risk that just as pull into the station you transmit a signal and somebody filling up on the other side of your pump gets toasted.

Seriously how are most mobile packet setups wired? Are they wired into the ignition which would turn the radio off when you turn off the engine? The problem with this is that if someone steals your car and parks it somewhere you won't be able to determine its location.

I'd be keen to hear how people wire and use their mobile setups.

Thanks Peter

Then switch it off before you go into the filling station.

I think you may be misunderstanding something - Most mobile APRS installations use a transceiver and a normal ham antenna, they are not clandestine installations. So if someone steals your car, unless they are stupid, they will very probably switch it off.

However, wiring it via the ignition does not solve your perceived problem, unless you are in the habit of switching off the engine and coasting up to the pump!

How would this happen? Could there really be sparking from the aerial or something (which you think you'd notice because it might interfere with your radio operation) or could it just get really hot? Is the idea that the EM radiation alone could cause ignition? I just have a hard time understanding this risk - the only blowing-up instances I'm aware of involved naked flames, yet you'd have thought that cars were inherently full of spark potential anyway being full of metal bits with high-current wiring.

The issue of filling station fires and explosions from cell phone use has been extensively investigated per what I think was a complete PBS program on this that I watched. In short, at cell phone power levels, they were totally unable to provoke explosions or fires from arcing or whatever.

What they did discover is that the real problem with explosions and fires at filling stations, other than the obvious like smoking and other open flames, was in the static issue from people sliding off car seats! The build-up of static electricity on the person's body getting out of the vehicle and the resultant spark when they discharged to whatever the next touched, or brushed, was the very surprising and real danger of explosions and fires in filling station accidents.

And on another note, per my long ago training in aviation safety as a long time flight instructor here in the USA, ambient temperature is related to this in an interesting way. As the temperature goes down, way down, the gasoline vapor ignition hazard goes down and the jet fuel hazard goes up! Haven't thought about extending that thought to modern auto-life. But one would think that if you are way down in temperature, a diesel vehicle owner would be more at risk from swishing across a neat cloth seat than a gasoline vehicle owner. Per the article seen, at cell phone power levels and around that, one can pretty well forget causing havoc with them. I'm not passing judgement here, wouldn't yap on a device in a service station anyway. Just passing on what I saw on TV.

The "RF sources causing a spark which causes ignition" is, as far as I can tell, little more than a modern myth. Static electric discharge is far more likely to cause ignition than any RF source of the power levels that amateur or cellular equipment puts out.

For example: You pull up to the pump, get out, start the fuel going. The biggest and most dangerous mistake you can then possibly make, especially if you're wearing synthetic-laden clothing and/or shoes, is to get back in your car to do something, then get back out and touch the metal of the fuel dispenser handle.

The effect is the exact same thing as scuffing your feet on a carpet, or getting up out of a synthetic chair, and touching a doorknob. ZAPP!! With a big enough spark, and enough fuel vapor around the filler port, you could easily cause a small fire or risk of an explosion.

Best possible thing you can do: Touch the metal body of your car at least a foot or so away from the filler port BEFORE you touch the pump dispenser.

> Have APRS users considered this possibility and what precaustions, if any,
> are taken to deal with this problem?

Well, I make it a point to touch body metal, away from the filler pipe, before I touch the pump dispenser handle. That, and I make it a habit of never getting back into the car between the time I start and stop fueling.

I have also left my own 25-watt APRS transceiver powered and operational during many fuel stops. Never once did I feel the least threatened by it, and never once has it caused a problem.

Worry about ESD. It's a far greater threat than any RF source.

Peter, all.

Already been done. Most loco's in NSw are already GPS equiped. NCD can see
all loco's equiped with GPS and thier location throughout the state.
Operators can access a screen that displays thier logged on loco's.

Not certain on this one, but is there a requirement for loco's in NSW
(especially lead ones) to be equipted with GPS?

Gavin

TechCentralStation receives "advertising" money from MICROSOFT as a
way to take funding without it appearing to be corporate payments to a
well-known propaganda mill for the far-right.

Ah yes the science whores at TechCentralStation spreading their legs
for
billionaire drunkard paranoiac Richard Mellon Scaife. Sallie Balliunas
and Willie Soon, dropping their drawers in public acts of
prostitution, sometimes "consultants" for CO2Science, Greening Earth
Society, and any other drunken sailor with five bucks in his pocket.

The Judge hauls in twenty drunk sailors and asks Willie Balliunas
"which one of these sailors gave you only two bits for a blowjob"? and
Sallie Soon answers "all of them".

Well, I was wondering when you would get to discussing the topic of
AWOL BUSH dodging the draft by hiding in the National Guard then
dodging the national guard while hiding cocaine up his nose? Would the
answer be on that link to paid science-whores employed by the coal
industry?

Is that where we find the truth about drunk-driver AWOL Bush
"Commander-in-Thief" who kills one soldier a day in Halliburton's
blood for oil program?

Do you think the Western Fuels Asses who contribute so much money for
so much government corporate welfare payments have the answer? Is that
why you
put the Western Fuels Ass website link in your message?

In Iraq, US soldiers are endangered by roadside bombs, set off with remote control units made for radio control toy trucks. The terrorists packet the toy truck with explosives, bury it by the road, and space off a short distance with the remote control unit, ready to set off the bomb.

The US soldiers have come up with a solution which involves taping the control levers over, on a toy remote transmitter so that the transmitter continuously sends out a signal. The transmitter sits on the dash of the lead truck in the convoy, and sets the bombs off while the convoy is still as much as 100 feet away.

Maybe concerned APRS users should install a simple spark generator in the grill of thier cars, to set off any gasolene fumes while they are still a safe distance away, eh?

Hi again

It looks like I've started World War III with this topic.

I think it is a shame that some are glossing over the topic because safety with petroleum is a serious issue. Maybe APRS does not pose a hazard but the topic deserves serious discussion.

One solution that I have devised (although I am not sure if it would be easy to implement), is the following. (this is the kind of setup I had in mind for my car)

Equipment:

1 x old notebook computer with sound card to act as modem
1 x mouse gps - usb connection
1 x 2m ht

The idea is that the ht would sit on 144.900 mhz and listen for aprs packets. It would however only supply an aprs packet if polled remotely (ie you have to send it a special code to start transmitting aprs packets) however so most of the time there is no transmission. If you fill up at a pretrol station there is no danger because your setup is not transmitting at all.

Say your car gets stolen. You send a particular code through the aprs system and tell the notebook computer to start transmitting aprs packets every minute. You then track the car until the police catch up with it.

Workable but safe?

cheers Peter

Hi,

I am currently implementing a TNC using an ATmega32 and a CMX589a GMSK modem.

Currently, my main worry is how to handle the abovementioned.

The AX.25 v2.2 paper states that "Parameter negotiation occurs at any time" (6.3.2, first paragraph).

What I am unable to read out of the protocol (Warning bells coming on, "implementation dependent" flashing in big, red letters) is whether parameter negotiation is mandatory to establish a connection (As opposed to just using a predefined set of parameters), and, if it _is_ mandatory - what happens if "my" TNC answers a SABM command frame with a UA frame (thus, accepting the connection) and a XID command frame containing non-negotiable parameters, then discarding the XID response from the originating TNC.

I am assuming the originating TNC will be able to accept the sent parameters, and that a connection will be established. My concern is what happens if the originating TNC should feel like renegotiating the parameters after the connection has been established.
What happens then?

a) Will the connection be terminated, as "my" TNC does not send a response to the XID command frame from the originating TNC?

b) Will the originating TNC try to keep ut the connection using the parameters received in the XID command frame "my" TNC sent immediately after link estab

c) Implementation dependent?

Any thoughts appreciated. Thanks,

--

<< >Then switch it off before you go into the filling station.<>>
<<And how close to the tanks could one be without switching off?
How about passing the station on the street, possibly with the tank vent
pipes between the street (i.e. yourself) and the pumps? >>

The major problem you'd have is static electricity. RF will pose no problem in the normal amounts emitted by a standard mobile rig (i.e., 5-50 wts). The ignition method most commonly seen is static buildup, person does not discharge against the car body before touching the nozzle (grounded to the pump via the hose...it has a wire mesh and/or grounding wire built into it). Nice spark results, as does ignition of the vapors. One thing that was noted....women are more likely to have this happen...best guess is due to two reasons. One, material in clothing may be higher in static-generating capability. Second, on cold days, women tend to return to the car and wait for the tank to fill. When they get out, they're a nice static source looking for a ground. The nozzle provides that.

As for RF, we used to use an old Clegg FM27B to test the electronics (faraday chamber)....never had any fuel ignition problems, and the lockup problems were mostly due to ground loop situations which were resonant on some more commonly used frequency, such as 400 mhz +/-. Drove one prototype unit nuts until the chief engineer (also a ham) happened to key his 70cm rig when sitting by the unit. Turns out the local police liked the donuts sold at the station......

I'm busy getting a digital setup together. I'd like to use my soundcard.

The radio I'll be using is an Alinco DR 610T. It has the following specs for digital signals:

Transmit audio input 1200bps: 10mV p-p - 2.7Kilohms.(Microphone input)
Transmit audio input 9600bps: 2V p-p - 10Kilohms.

Recieve audio output 9600bps (from FM detector stage): 300mV p-p - 47Kilohms
Recieve audio output 1200bps: taken from the auxiliary speaker jack, so I'm assuming 8 Ohms and for the voltage will have to fiddle the volume knob until its right (or the soundcard gets toasted!)

Now my question is: Will a soundcard function correctly within these parameters or do I need to add impedance and voltage matching circuitry?

This can happen on Usenet. Please don't top-post. I lost the context of the specific message you were replying to because you did so.

> I think it is a shame that some are glossing over the topic because safety
> with petroleum is a serious issue. Maybe APRS does not pose a hazard but the
> topic deserves serious discussion.

Of course it's a serious issue. It's just that electrostatic discharge is a far greater hazard around filling stations than any amount of RF energy would be.

The bottom line is that you should worry more about what you're wearing, and whether your body is carrying a static charge, than about whether you've got an active transmitter. The signs you see are presenting more disinformation than anything else, and I'm sorry that those who mandated they be put in place didn't do their homework a little better.

Hi guys

MixW multimode software is now into release 2.11. If you are into various "data" etc modes on HF or VHF then it is a good piece of work. Course there are other software's around too.

Check out my software download page:

www.g3vfp.org/download.html

Cheers, and enjoy.

SETTING UP KENWOOD TM-V7A FOR PACKET/APRS USE

1. PUT 144.39 ON THE LEFT SIDE. (USA APRS frequency)
2. PUT FAVORITE REPEATER ON THE RIGHT SIDE.
3. PRESS "MNU" AND CLICK TO ITEM 15 "DATA TRANSFER".
4. PRESS THE "V" AND CLICK TO '.2' "DATA BAND".
5. PRESS "SET" AND TURN IT "ON".
6. PRESS "MNU". YOU WILL SEE THE WORD "DATA" OVER THE LEFT (144.39) AND "PTT" OVER THE RIGHT.

TO DO VHF/VHF OR 2METER VOICE REPEATER AND PACKET AT THE SAME TIME:
1. PRESS THE RIGHT BAND SELECT BUTTON.
2. PRESS 'F' + [CONT.SEL.] (LITTLE BUTTON BETWEEN VOL CONTROLS).
3. MAKE SURE 'PM AUTO STORE' IS ON SO YOU DONT LOSE ALL SETTINGS WHEN YOU TURN OFF THE RADIO. (SEE PAGE 39 OF THE MANUAL).

Below are the pinouts

KENWOOD TM-V7A DATA JACK PINS:
1. PKD IS TX (MIC) AUDIO   (connect to KPC-3 Pin #1- TX AUDIO)
2. DE IS GROUND   (connect to KPC-3 Pin #9- GROUND)
3. PKS IS PTT   (connect to KPC-3 Pin #3- PTT)
4. PR1 IS RX AUDIO   (connect to KPC-3 Pin #5- RX AUDIO)

KPC-3 PLUS DB-9   (if you have the KPC-3 original ... no change)

1- TX AUDIO
2- GPS DATA IN
3- PTT
4-
5- RX AUDIO 'TIP'
6- GROUND (GPS/RX-AUDIO)
7-
8-
9- GROUND FOR MIC

AX.25 would work well in this application. The key to low power consumption would be in the selection of the equipment itself. AX.25 does allow for acknowledged transmissions... it's just that most locational services these days are using UI frames which are generally unacknowledged. There's no reason you couldn't run this in connected mode, which would ensure virtually error free delivery. The AX.25 protocol also has built in a digipeting function so each station would only have to send a signal as far as the next station, rather than the full 150 mile range of the system. You could also save power by putting the whole system to "sleep" for significant periods and having it wake up from time to time to communicate data.

IRLP is really a different beast altogether. It is essentially a Voice over IP scheme and would not be appropriate for the project you have in mind.

If I can provide any additional information for you, I can be contacted at:

>The AX.25 v2.2 paper states that "Parameter negotiation occurs at any time"
>(6.3.2, first paragraph).

I have a few questions...

o   Why are you implementing v2.2 rather than 2.0? My
     impression was that very few, if any, devices implement

v2.2.

o Does anyone have a list of v2.2 implementations? How complete are these implementations?

o What compatibility requirements do you have? It seems that if you want to talk to most existing TNCs, you want to implement v2.0. If you don't have compatibility requirements, I might consider something other than AX.25 v2.2. Perhaps IP over X.25 LAPB/HDLC ABM (i.e., roughly AX.25 v2.2 without out the call-sign source routing stuff).

Beyond that, the CCITT X.25 Recommendations may provide you some additional insight. The AX.25 specs map pretty directly into a subset of the colored books. Mine are at home, so I can't look at them at the moment...

On the other hand, I think you may get authoritative answers to all of the above on this news group.

Would not even need a laptop; just a Palm to do this.

You could even use a PalmPhone, and add to it a "kill switch" on the

ignition, a flow restictor on the gas (won't go over 10kph) or a "park lock
override" on the transmission (if automatic) which would prevent the
vehicle from getting out of Park.

Would take the fun out of using APRS, but you'd get your car back a lot
faster.

I agree with the comment at the end. I'm no lawyer, but what about
the liability you have by activating a transmitter in a stolen car and
blowing up the thief and a gas station?

Are there laws against booby-trapping cars?

Last year my car was stolen in St Kilda and was found 6 months later parked about 10 blocks east of where it was stolen. An APRS system would have been very useful.

I also dream about somebody stealing my car so I use APRS to track where it is and advise the Police. Then when they give me the signal I kill the engine by remote control and possibly have a digital camera installed in the car to photograph the driver.

:)

Could be fun. I'd almost want someone to steal my car!

cheers Peter

Does anyone remember the Motorola TVBUG...

I got one sometime ago, no cost, it came with a 1/8 inch booklet...

Does anyone know of any website where someone put one to use?

I work XP with the AGWE programme for packet and Winpack with UI-veiw also
sometimes I have never had a problem with it......I bought an interface for
�20 on e-bay (but could make one for �7)
have a search for "soundcard packet" on the web and save yourself alot of
money........and enjoy alot of modes......
